Physiology and Pathophysiology of the Extracellular Calcium-Sensing Receptor Enikő Kallay,2018-07-09 Calcium is vital for human physiology it mediates multiple signaling cascades critical for cell survival differentiation or death both as first and as second messenger The role of calcium as first messenger is mediated by the G protein coupled receptor the extracellular calcium sensing receptor CaSR The CaSR is a multifaceted molecule that senses changes in the concentration of a wide variety of environmental factors including di and trivalent cations amino acids polyamines and pH In calcitropic tissues with obvious roles in calcium homeostasis such as parathyroid kidney and bone it regulates circulating calcium concentrations The germline mutations of the CaSR cause parathyroid disorders demonstrating the importance of the CaSR for the maintenance of serum calcium homeostasis The CaSR has an important role also in a range of non calcitropic tissues such as the intestine lungs central and peripheral nervous system breast skin and reproductive system where it regulates molecular and cellular processes such as gene expression proliferation differentiation and apoptosis as well as regulating hormone secretion and lactation This Research Topic is an overview of the CaSR and its molecular signaling properties together with the various organ systems where it plays an important role The articles highlight the current knowledge regarding many aspects of the

calcitropic and non calcitropic physiology and pathophysiology of the CaSR
