Basic Mechanisms In Hearing:

Basic Mechanisms in Hearing Aage Moller, 2012-12-02 Basic Mechanisms in Hearing is a collection of papers that discusses the function of the auditory system covering its ultrastructure physiology and the mechanisms connection with experimental psychology Papers review the mechanics morphology and physiology of the cochlear including the physiology of individual hair cells and their synapses One paper examines the combined physiological and anatomical studies of stimulus coding in the mammalian auditory nervous system The results of these studies pertain to the latency frequency selectivity and time pattern of responses to short tone bursts Other research compare the cochlear nerve behavioral and psychophysical frequency selectivity which show that frequency selectivity of the auditory system occurs at the level of the cochlear nerve becoming downgraded in end organ deafness Other papers discuss neural coding at higher levels such as the feature extraction in the auditory system of bats Some papers also analyze the specialized hearing mechanisms in animals for example the echolocation of bats and in some insects the function of the swimbladder in fish hearing as well as the invertebrate frequency analyzer in the locust ear Physiologists neurophysiologists neurobiologists general medical practitioners and ENT specialists will find this collection valuable **National Library of Medicine Current Catalog**

Peripheral Auditory Mechanisms J.B. Allen, J.L. Hall, A. Hubbard, S.T. Neely, A. Tubis, 2013-06-29 How well can we model experimental observations of the peripheral auditory system What theoretical predictions can we make that might be tested It was with these questions in mind that we organized the 1985 Mechanics of Hearing Workshop to bring together auditory researchers to compare models with experimental observations The workshop forum was inspired by the very successful 1983 Mechanics of Hearing Workshop in Delft 1 Boston University was chosen as the site of our meeting because of the Boston area's role as a center for hearing research in this country We made a special effort at this meeting to attract students from around the world because without students this field will not progress Financial support for the workshop was provided in part by grant BNS 8412878 from the National Science Foundation Modeling is a traditional strategy in science and plays an important role in the scientific method Models are the bridge between theory and experiment They test the assumptions made in experimental designs They are built on experimental results and they may be used to test hypotheses and predict experimental results The latter is the scientific method at its best Cochlear function is very complicated For this reason models play an important role One goal of modeling is to gain understanding but the necessary mathematical tools are often formidably complex An example of this is found in cochlear macromechanics **Facts and Models in Hearing** E. Zwicker, E. Terhardt, 2013-03-12 During recent years auditory research has advanced quite rapidly in the area of experimental psychology as well as in that of physiology Scientists working in both areas have in common the study of the process in HEARING yet different scientific areas always tend to diverge A SYMPOSIUM ON PSYCHOPHYSICAL MODELS AND

PHYSIOLOGICAL FACTS IN HEARING was organized for the exchange of information and to stimulate discussion between research workers in psychoacoustics neurophysiology anatomy morphology and hydromechanics The basic aim of holding this symposium was to halt the divergence and to initiate the kind of multidisciplinary research that will be needed to elucidate the hearing process as a whole The present proceedings comprise the papers which were circulated to the participants two months before the symposium and discussed during the symposium together with some comments and additional remarks These comments and remarks do not however represent the full discussions but only the parts available in written form We have arranged the material in five sections I Structure and Neurobiology of the Inner Ear II Cochlear Mechanisms III Auditory Frequency Analysis IV Auditory Time Analysis V Nonlinear Effects Within the limits of a symposium none of these topics could be treated comprehensively moreover most of the papers concerned problems having several aspects

after heated and often bitter debates SIEBENMANN'S opinion finally prevailed i.e. a contribution to cochlear lesions due to vibrations of the floor transmitted via bone conduction could not be demonstrated For one thing it was hard to see how appreciable amounts of energy could reach the ears in this manner considering the attenuation that is bound to occur across each of the many joints along the pathway involved In some older audiological surveys conducted in industry e.g. TEMKIN 1933 groups of workmen were found who displayed signs of apical turn lesions i.e. low tone hearing losses for air and for bone Such lesions could not be expected to result from exposure to air borne sounds because of the low frequency attenuation of the middle ear Although WITTMACK'S explanation which was frequently invoked in such reports does no longer appear tenable such apical turn lesions could conceivably be caused by bone conduction components of high intensity noise in the sense of BEKESY 1948 As far as I am aware of no newer studies have been conducted in this problem area and the older experiments and/or surveys were done at times before signal parameters could be precisely controlled or measured A detailed critical review of the older studies on the potential contribution of bone conducted energy to industrial hearing loss and its underlying pathology may be found in Werner 1940 who incidentally favored SIEBENMANN'S point of view

Cochlear Mechanisms: Structure, Function, and Models J. Wilson, 2012-12-06

Great advances have been made in understanding hearing in recent years In particular the mechanical function of the cochlea has become the focus of intense interest This started in one direction with the discovery of otoacoustic emissions in 1978 which required active mechanical amplification processes as first postulated by Gold in 1948 Direct evidence for the role of this mechanism in sharpening up the otherwise poor basilar membrane tuning properties was provided in 1982 and in 1983 motility was shown in outer hair cells In parallel an immense amount of work has been done on the electrophysiology of hair cells following the first intracellular recordings in

1977 Over a longer time scale models of basilar membrane motion have been developed and refined and recently much effort has been put into incorporating active mechanisms and non linear processes It seemed an opportune time to bring together the leading workers in these various areas to take stock of the whole field and to stimulate further progress This book represents the proceedings of a NATO ARW on the Mechanics of Hearing held at the University of Keele 3-8 July 1988 The conception of the meeting owes much to earlier meetings held in Boston in 1985 Peripheral Auditory Mechanisms Eds J B Allen J L

Auditory Mechanisms: Processes And Models - Proceedings Of The Ninth International Symposium (With Cd-rom) Alfred L Nuttall, Egbert Deboer, Peter Gillespie, Karl Grosh, Tianying Ren, 2006-08-10 The workshop brought together experts in genetics molecular and cellular biology physiology engineering physics mathematics audiology and medicine to present current work and to review the critical issues of inner ear function A special emphasis of the workshop was on analytical model based studies Experimentalists and theoreticians thus shared their points of view The topics ranged from consideration of the hearing organ as a system to the study and modeling of individual auditory cells including molecular aspects of function Some of the topics in the book are motor proteins in hair cells mechanical and electrical aspects of transduction by motor proteins function of proteins in stereocilia of hair cells production of acoustic force by stereocilia mechanical properties of hair cells and the organ of Corti mechanical vibration of the organ of Corti wave propagation in tissue and fluids of the inner ear sound amplification in the cochlea critical oscillations cochlear nonlinearity and mechanisms for the production of otoacoustic emissions This book will be invaluable to researchers and students in auditory science

Auditory Physiology Aage Møller, 2012-12-02 Auditory Physiology describes the functions of the ear and the auditory nervous system using well documented research work This book explains the physiology of the ear

the general function of the auditory nervous system and its anatomy This text also discusses in detail the neurophysiological basis for discriminating frequency and time This discrimination refers in particular to 1 the ability to distinguish two sounds on the basis of their frequencies when the two sounds are not presented at the same time and 2 the ability to discriminate one spectral component in a complex sound that contains several spectral components This book notes that for low frequencies temporal analysis is more useful in processing complex sounds than the simple determination of energy in different frequency bands Research shows that particular spatial patterns of response to different characteristic of complex sounds can exist which are not feature detectors such as neurons specifically tuned to special and complex properties of a certain stimulus This book can prove beneficial for physiologists neurobiologists neurophysiologists general medical practitioners and EENT specialists
