Basic Mechanisms Of Ocular Motility And Their Clinical Implications:

Basic Mechanisms of Ocular Motility and Their Clinical Implications Gunnar Lennerstrand, Paul Bach-y-Rita, 1975

Perceiving in Depth, Volume 1: Basic Mechanisms Ian P. Howard, 2012-01-27 The three volume work *Perceiving in Depth* is a sequel to *Binocular Vision and Stereopsis* and to *Seeing in Depth* both by Ian P Howard and Brian J Rogers This work is much broader in scope than the previous books and includes mechanisms of depth perception by all senses including aural electrosensory organs and the somatosensory system Volume 1 reviews sensory coding psychophysical and analytic procedures and basic visual mechanisms Volume 2 reviews stereoscopic vision Volume 3 reviews all mechanisms of depth perception other than stereoscopic vision The three volumes are extensively illustrated and referenced and provide the most detailed review of all aspects of perceiving the three dimensional world Volume 1 starts with a review of the history of visual science from the ancient Greeks to the early 20th century with special attention devoted to the discovery of the principles of perspective and stereoscopic vision The first chapter also contains an account of early visual display systems such as panoramas and peepshows and the development of stereoscopes and stereophotography A chapter on the psychophysical and analytic procedures used in investigations of depth perception is followed by a chapter on sensory coding and the geometry of visual space An account of the structure and physiology of the primate visual system proceeds from the eye through the LGN to the visual cortex and higher visual centers This is followed by a review of the evolution of visual systems and of the development of the mammalian visual system in the embryonic and post natal periods with an emphasis on experience dependent neural plasticity An account of the development of perceptual functions especially depth perception is followed by a review of the effects of early visual deprivation during the critical period of neural plasticity on amblyopia and other defects in depth perception Volume 1 ends with accounts of the accommodation mechanism of the human eye and vergence eye movements

John Leigh Professor, Neuroscience Otolaryngology and Biomedical Engineering Case Western Reserve University University Hospitals and Veterans Affairs Medical Center Cleveland Ohio, Departments of Neurology David S. Zee Professor, Ophthalmology Otolaryngology Head and Neck Surgery and Neuroscience, 1999-08-26 *The Neurology of Eye Movements* provides clinicians with a synthesis of current scientific information that can be applied to the diagnosis and treatment of disorders of ocular motility Basic scientists will also benefit from descriptions of how data from anatomical electrophysiological pharmacological and imaging studies can be directly applied to the study of disease By critically reviewing such basic studies the authors build a conceptual framework that can

be applied to the interpretation of abnormal ocular motor behavior at the bedside These syntheses are summarized in displays new figures schematics and tables Early chapters discuss the visual need and neural basis for each functional class of eye movements Two large chapters deal with the evaluation of double vision and systematically evaluate how many disorders of the central nervous system affect eye movements This edition has been extensively rewritten and contains many new figures and an up to date section on the treatment of abnormal eye movements such as nystagmus A major innovation has been the development of an option to read the book from a compact disc make use of hypertext links which bridge basic science to clinical issues and view the major disorders of eye movements in over 60 video clips This volume will provide pertinent up to date information to neurologists neuroscientists ophthalmologists visual scientists otalaryngologists optometrists biomedical engineers and psychologists

Vision and Action Laurence R. Harris, Laurence Harris, Michael Jenkin, 1998-10-13 This book is about the two way interplay between vision and action Vision acts to guide and control actions But vision also obtains a lot of information about the world by virtue of these actions for example by moving round an object to obtain successive views This becomes a reiterative process and it is this that is the focus of this volume This book contains contributions from scientists who are leaders in each of the several facets of the subject Examples of the types of action considered vary from moving the eyes and head and body as in looking around or walking to complex actions such as driving a car or playing table tennis

Vision and Goal-Directed Movement Digby Elliott, Michael Khan, 2010-02-05 Vision and Goal Directed Movement Neurobehavioral Perspectives is also available as an e book The e book is available at a reduced price and allows readers to highlight and take notes throughout the text When purchased through the Human Kinetics Web site access to the e book is immediately granted when the order is received To interact with the environment an individual must code store and translate spatial information into the appropriate motor commands for achieving an outcome Working from this premise Vision and Goal Directed Movement Neurobehavioral Perspectives discusses how visual perception attention and memory are linked to the processes of movement preparation and execution With contributions from active researchers in movement science Vision and Goal Directed Movement presents the latest theories on the utilization of vision in goal directed movement control As a resource for motor control and motor learning researchers students educators and clinicians Vision and Goal Directed Movement offers the following Comprehensive coverage of current behavior based literature on the visual control of goal directed movement A systematic explication of the sensory and physiological processes and systems responsible for fast accurate and efficient performance A solid foundation for further study of the sensory and neural systems responsible for precise goal directed behavior A discussion of how current research on vision and goal directed movement can assist in creating efficient and safe work environments Using research informed by neural imaging and magnetic brain stimulation this text provides readers with a better understanding of the neural foundations for goal directed movement illustrates the flexibility of the human visuomotor system and discusses how regulation of movements depends on the

learning and developmental history of the performer It begins by reviewing the works of R S Woodworth and the influence of his theories on current research The majority of the chapters in the first section of the book take a behavioral and process oriented approach to exploring goal directed movement The text then explores the sensory and neural foundations for goal directed action including issues related to both pursuit and saccadic eye movements as well as discussion of the specialization of various cortical systems for the regulation of movement Especially relevant to professionals and scientists concerned with skill instruction and rehabilitation the final part of the text provides a review of recent research on how and why limb control changes occur with practice and development In addition Vision and Goal Directed Movement considers how the research presented can maximize precision efficiency and safety in workspace design Vision and Goal Directed Movement Neurobehavioral Perspectives adds a unique offering to the literature base for motor behavior demonstrating how advances in both behavioral and neurophysiological methods can inform theories related to the biological systems contributing to skilled performance

Exploratory Vision Michael S. Landy, Laurence T. Maloney, Misha Pavel, 2012-12-06

Advances in sensing signal processing and computer technology during the past half century have stimulated numerous attempts to design general purpose machines that see These attempts have met with at best modest success and more typically outright failure The difficulties encountered in building working computer vision systems based on state of the art techniques came as a surprise Perhaps the most frustrating aspect of the problem is that machine vision systems cannot deal with numerous visual tasks that humans perform rapidly and effortlessly In reaction to this perceived discrepancy in performance various researchers notably Marr 1982 suggested that the design of machine vision systems should be based on principles drawn from the study of biological systems This neuro morphic or anthropomorphic approach has proven fruitful the use of pyramid multiresolution image representation methods in image compression is one example of a successful application based on principles primarily derived from the study of biological vision systems It is still the case however that the performance of computer vision systems falls far short of that of the natural systems because they are intended to mimic suggesting that it is time to look even more closely at the remaining differences between artificial and biological vision systems

Three-dimensional Kinematics of the Eye, Head and Limb Movements M Fetter, T Haslwanter, H Misslich, D Tweed, 1997-09-09

The 19th century pioneers of motor physiology Helmholtz Hering Fick and others used the mathematics of motion known as kinematics to describe the laws of human movement and to deduce the neural control principles underlying these laws After long neglect partly due to limitations in stimulation and recording techniques the kinematic approach is now resurging fortified with modern computers and electrophysiology New developments in recording techniques as well as an improved understanding of the complex control properties of three dimensional movements have led to a flood of new research in this area The classical laws of Donders and Listing have been confirmed and generalized and computer simulations of the neural control of three dimensional movement have been developed and tested In this book some

of the world's leading scientists of motor control discuss how the brain represents and transforms the kinematic variables of movement. Background chapters explain the basic concepts: non-commutativity, redundancy, and the classical laws and their application to normal function and motor disorders; and shorter articles describe current research. The contributions are based on presentations at a symposium held in Tübingen in August 1995. The wide scope of the book should enable researchers to gain an overview of current research but should also help newcomers to the field to get a good understanding of the questions and problems involved in three-dimensional movement control.

Parallel Processing in the Visual System Jonathan Stone, 2013-03-08 In the mid sixties John Robson and Christina Enroth Cugell, without realizing what they were doing, set off a virtual revolution in the study of the visual system. They were trying to apply the methods of linear systems analysis, which were already being used to describe the optics of the eye and the psychophysical performance of the human visual system, to the properties of retinal ganglion cells in the cat. Their idea was to stimulate the retina with patterns of stripes and to look at the way that the signals from the center and the antagonistic surround of the receptive field of each ganglion cell first described by Stephen Kuffler interact to generate the cell's responses. Many of the ganglion cells behaved themselves very nicely, and John and Christina got into the habit they now say of calling them "interesting cells." However, to their annoyance, the majority of neurons they recorded had nasty nonlinear properties that couldn't be predicted on the basis of simple summation of light within the center and the surround. These uncooperative ganglion cells, which Enroth Cugell and Robson at first called "dull cells," produced transient bursts of impulses every time the distribution of light falling on the receptive field was changed, even if the total light flux was unaltered.

Essential Zebrafish Methods: Cell and Developmental Biology Monte Westerfield, Leonard I. Zon, H. William Detrich III, 2009-08-27 Due to its prolific reproduction and the external development of the transparent embryo, the zebrafish is the prime model for genetic and developmental studies as well as research in genomics. While genetically distant from humans, nonetheless, the vertebrate zebrafish has comparable organs and tissues that make it the model organism for study of vertebrate development. This book, one of two new volumes in the Reliable Lab Solutions series dealing with zebrafish, brings together a robust and up-to-date collection of time-tested methods presented by the world's leading scientists. Culled from previously published chapters in *Methods in Cell Biology* and updated by the original authors where relevant, it provides a comprehensive collection of protocols describing the most widely used techniques relevant to the study of the cellular and developmental biology of zebrafish. The methods in this volume were hand-selected by the editors whose goal was to provide a handy and cost-effective collection of fail-safe methods, tips, and tricks of the trade to both experienced researchers and more junior members in the lab. Provides busy researchers a quick reference for time-tested methods and protocols that really work, updated where possible by the original authors. Gives pragmatic wisdom to the non-specialist from experts in the field with years of experience with trial and error.

The Role of Eye Movements in Perceptual Processes E. Chekaluk, K.R. Llewellyn, 1992-07-06 It has become a truism that the frozen optical diagram representation of vision is the worst possible picture of the way in which we visually interact with the environment Even apart from our reaction to moving targets by pursuit movements our visual behaviour can be said to be characterised by eye movements We sample from our environment in a series of relatively brief fixations which move from one point to another in a series of extremely rapid jerks known as saccades Many questions arising from this characteristic of vision are explored within this volume including the question of how our visual world maintains its perceptual stability despite the drastic changes in input associated with these eye movements
