Creativity in Theatre Suzanne Burgoyne, 2018-09-14

People who don't know theatre may think the only creative artist in the field is the playwright with actors directors and designers mere interpreters of the dramatist's vision Historically however creative mastery and power have passed through different hands Sometimes the playwright did the staging In other periods leading actors demanded plays be changed to fatten their roles The late 19th and 20th centuries saw the rise of the director in which director and playwright struggled for creative dominance But no matter where the balance of power rested good theatre artists of all kinds have created powerful experiences for their audience The purpose of this volume is to bridge the interdisciplinary abyss between the study of creativity in theatre drama and in other fields Sharing theories research findings and pedagogical practices the authors and I hope to stimulate discussion among creativity and theatre scholar teachers as well as multidisciplinary research Theatre educators know from experience that performance classes enhance student creativity This volume is the first to bring together perspectives from multiple disciplines on how drama pedagogy facilitates learning creativity Drawing on current findings in cognitive science as well as drama teachers lived experience the contributors analyze how acting techniques train

the imagination allow students to explore alternate identities and discover the confidence to take risks The goal is to stimulate further multidisciplinary investigation of theatre education and creativity with the intention of benefitting both fields

Contemporaneous Issues about Creativity Lisete Barlach,2025-02-26 Over the last decades scholars and practitioners have studied creativity as the production of original and effective ideas capable of being applied to different fields of existence More recently it has been recognized as one of the most important skills for the 21st century as a differential for professionals and as a basis for innovation Even with this acknowledgement creativity is being challenged by advances in Artificial Intelligence especially generative intelligence which is seen as capable of performing creative activities and eventually replacing human creativity Besides that more and more is said about the role of schools in preparing for this new world by developing creativity to enhance opportunities for work and careers The book goes beyond by introducing the relationship between creativity and mental health defying the standard view which associates creativity with madness and taking creativity as a tool for therapeutic processes

Volume II Francisco Parra-Luna, 2009-10-30 The subject Systems sciences and cybernetics is the outcome of the convergence of a number of trends in a larger current of thought devoted to the growing complexity of primarily social objects and arising in response to the need for globalized treatment of such objects This has been magnified by the proliferation and publication of all manner of quantitative scientific data on such objects advances in the theories on their inter relations the enormous computational capacity provided by IT hardware and software and the critical revisiting of subject object interaction not to mention the urgent need to control the efficiency of complex systems where efficiency is understood to mean the ability to find a solution to many social problems including those posed on a planetary scale The result has been the forging of a new academically consolidated scientific trend going by the name of Systems Theory and Cybernetics with a comprehensive multi disciplinary focus and therefore apt for understanding realities still regarded to be inescapably chaotic This subject entry is subdivided into four sections The first an introduction to systemic theories addresses the historic development of the most commonly used systemic approaches from new concepts such as the so called geometry of thinking or the systemic treatment of non systemic identities to the taxonomic entropic axiological and ethical problems deriving from a general systemic cybernetic conceit Hence the focus in this section is on the historic and philosophical aspects of the subject Moreover it may be asserted today that beyond a shadow of a doubt problems in particular problems deriving from human interaction but in general any problem regardless of its nature must be posed from a systemic perspective for otherwise the obstacles to their solution are insurmountable Reaching such a perspective requires taking at least the following well known steps a statement of the problem from the determinant variables or phenomena b adoption of theoretical models showing the interrelationships among such variables c use of the maximum amount of wherever possible quantitative information available on each d placement of the set of variables in an environment that inevitably pre determines the problem That epistemology would explain the substantial development of the systemic cybernetic approach in recent decades The articles in the second section deal in particular with the different methodological approaches developed when confronting real problems from issues that affect humanity as a whole to minor but specific questions arising in human organizations Certain sub themes are discussed by the various authors always from a didactic vantage including problem discovery and diagnosis and development of the respective critical theory the design of ad hoc strategies and methodologies the implementation of both qualitative soft system methodologies and formal and quantitative such as the General System Problem Solver or the axiological operational perspective approaches cross disciplinary integration and suitable methods for broaching psychological cultural and socio political dynamisms The third section is devoted to cybernetics in the present dual meaning of the term on the one hand control of the effectiveness of communication and actions and on the other the processes of self production of knowledge through reflection and the relationship between the observing subject and the observed object when the latter is also observer and the former observed Known as second order cybernetics this provides an avenue for rethinking the validity of

knowledge such as for instance when viewed through what is known as bipolar feedback processes through which interactions create novelty complexity and diversity Finally the fourth section centres around artificial and computational intelligence addressing sub themes such as neural networks the simulated annealing that ranges from statistical thermodynamics to combinatorial problem solving such as in the explanation of the role of adaptive systems or when discussing the relationship between biological and computational intelligence

Cybernetics of Art M. J. Rosenberg, 2024-07-31 First published in 1983 *Cybernetics of Art* uses the methodology and concepts of cybernetics to explore art and the creative process Part I surveys the domain that includes both science and the arts attempting to understand their differing viewpoints and the basis of conflicts between them Art is approached as a method of knowledge aimed at knowledge of experience per se as distinct from knowledge derived through experience Part II poses the problem of notionally constructing an authorship machine and develops the technical argument by exploring the question of the kind of machine it would need to be Part III examines the products of such a machine with a view to finding criteria for distinguishing those that might be called art An extended non technical commentary accompanies the text

throughout with the dual aim of comparing the book's technical conclusions with ideas expressed by critiques and practicing artists and assisting readers unfamiliar with the information sciences in following the argument. In a world dominated by artificial intelligence, this interdisciplinary book will be useful for scholars and researchers of cybernetics, art, and humanities and social sciences in general.

The volume includes a set of selected papers extended and revised from the International Conference on Informatics, Cybernetics, and Computer Engineering. Intelligent control is a class of control techniques that use various AI computing approaches like neural networks, Bayesian probability, fuzzy logic, machine learning, evolutionary computation, and genetic algorithms. Intelligent control can be divided into the following major sub domains: Neural network control, Bayesian control, Fuzzy logic control, Neuro fuzzy control, Expert Systems, Genetic control, Intelligent agents, Cognitive, Conscious control. New control techniques are created continuously as new models of intelligent behavior are created and computational methods developed to support them. Networks may be classified according to a wide variety of characteristics such as medium used to transport the data, communications protocol used, scale, topology, organizational scope, etc.

ICCE 2011 Volume 1 is to provide a forum for researchers, educators, engineers, and government officials involved in the general areas of Intelligent Control and Network Communication to disseminate their latest research results and exchange views on the future research directions of these fields. 90 high quality papers are included in the volume. Each paper has been peer reviewed by at least 2 program committee members and selected by the volume editor. Special thanks to editors, staff of association, and every participants of the conference. It's you make the conference a success. We look forward to meeting you next year.
