

TYPES OF SERVO

There are two main classes of servomechanism – remote position control (RPC) servos and velocity control servos (velodynes):

- **RPC servos.** These are used to control the angular, or linear position of a load. A typical example of the use of a RPC servo is the control of the direction in which a radar scanner is pointing.
- **Velodynes.** These are used to control the speed of a load. In this case, the speed of the driving motor is made proportional to the input demand (usually a voltage). A typical example of the use of a velodyne is the control of a radar scanner, which is required to rotate with a constant angular velocity

Flach, 2018-10-08 This textbook provides a tutorial introduction to behavioral applications of control theory Control theory describes the information one should be sensitive to and the pattern of influence that one should exert on a dynamic system in order to achieve a goal As such it is applicable to various forms of dynamic behavior The book primarily deals with manual control e g moving the cursor on a computer screen lifting an object hitting a ball driving a car both as a substantive area of study and as a useful perspective for approaching control theory It is the experience of the authors that by imagining themselves as part of a manual control system students are better able to learn numerous concepts in this field Topics include varieties of control theory such as classical optimal fuzzy adaptive and learning control as well as perception and decision making in dynamic contexts The authors also discuss implications of control theory for how experiments can be conducted in the behavioral sciences In each of these areas they have provided brief essays intended to convey key concepts that enable the reader to more easily pursue additional readings Behavioral scientists teaching control courses will be very interested in this book *A Survey of Stability Analysis Techniques for Automatically Controlled Aircraft* Arthur L. Jones, Benjamin R. Briggs, 1951 A survey of the stability analysis techniques for automatically controlled aircraft is presented The survey is limited to techniques commonly applied to linear continuous control systems wherein the difference between the output and input quantities is measured continuously and is used in the operation of the system a closed loop system An evaluation of the techniques based on the kind and amount of information derivable is included An illustrative example is also presented to demonstrate the calculations involved for a typical aircraft autopilot combination *Aviation Fire Control Technician 3 & 2* Johnny R.
