Cycle Of Erosion In Different Climates:

The Cycle of Erosion in Different Climates Pierre Birot, 2023-11-15 The Cycle of Erosion in Different Climates delves into the fascinating interplay between climatic factors and landform evolution rooted in Professor Birot's influential lectures in Brazil following the 1956 International Geographical Congress. This book serves as a bridge between the climatological focus dominant in continental Europe and the traditional Davisian geomorphological perspectives prevalent in English speaking regions. Birot offers a nuanced perspective that synthesizes contemporary insights with established theories resulting in a comprehensive examination of how erosion cycles operate across various climatic contexts. By analyzing processes like rock decomposition, debris transport on slopes and riverbed dynamics, the book provides a rich framework for understanding landform development. A key feature of this study is its exploration of the cycle of erosion which represents the evolution of slopes toward a level surface progressing through stages of youth, maturity and senility. The text discusses the intricate balance between weathering and transport mechanisms, emphasizing how climatic conditions influence these processes. From the dynamic interplay of water and detritus on slopes to the establishment of river profiles of equilibrium, Birot presents a vivid depiction of geomorphological phenomena. This English translation preserves the essence of the original French text while adapting terms and concepts to enhance accessibility for English speaking audiences. It not only fills a critical gap in the literature but also fosters greater international communication in geomorphology, underscoring the universal relevance of these natural processes. This title is part of UC Press's Voices Revived program which commemorates University of California Press's mission to seek out and cultivate the brightest minds and give them voice, reach and impact. Drawing on a backlist dating to 1893, Voices Revived makes high quality, peer reviewed scholarship accessible once again using print on demand technology. This title was originally published in 1968.

Geomorphology Andrew Goudie, 2013-04-15 Geomorphology the discipline which analyzes the history and nature of the earth's surface deals with the landforms produced by erosion, weathering, deposition, transport and tectonic processes. In recent decades there have been major developments in the discipline and these are reflected in this major Encyclopedia, the first such reference work in the field to be published for thirty five years. Encyclopedia of Geomorphology has been produced in association with the International Association of Geomorphologists (IAG) and has a truly global perspective. The entries have been written by an international editorial team of contributors drawn from over thirty countries who are all among the leading experts in the discipline. In two lavishly illustrated volumes, Encyclopedia contains nearly 700 alphabetically organized entries to provide a comprehensive guide both to specific landforms and to the major types of geomorphological processes that create them. The Encyclopedia also demonstrates the major developments that have taken place in recent

years in our knowledge of tectonic and climatic changes and in the use of new techniques such as modelling remote sensing and process measurement Older concepts however are not forgotten and provide an historical perspective on the development of ideas Both accessible and authoritative Encyclopedia of Geomorphology is destined to become the definitive resource for students researchers and applied practitioners in the field of geomorphology and the cognate disciplines of geography earth science sedimentology and environmental science

Climate, Earth Processes and Earth History

Richard J. Huggett, 2012-12-06 Today climate related processes and problems are referred to as Global Change by nearly everyone including scientists politicians and economists citizens worldwide are anxious about the often observed disorientation of our environment under the influence of man Better information on the Earth's natural systems and their possible alterations is necessary The topic itself is so wide that sound scientific descriptions of it as a whole are rare For the non specialist information from relevant fields is not easy to obtain and often the prognostic models presented are contradictory and even for specialists difficult to evaluate Therefore this book on Climate Earth Processes and Earth History by Richard Huggett fills an important gap It discusses the great climate related areas of the Earth's environment The atmosphere the hydrosphere the sediments as products of weathering and geomorphic processes the relief as landforms and soils and the biosphere are thoroughly treated as the prominent sub systems which are greatly affected by climate These subsystems not only control the visual and internal aspects of our landscapes but they are themselves especially influenced by climatic changes which can be due to either changes in the natural system or anthropogenic changes Thus our landscapes will be subject to significant alterations if climatic variations exceed certain thresholds The plan for the present book by Richard Huggett was originally discussed in regard to the Springer Series on Physical Environment *Process and Form in Geomorphology* David Stoddart, 2013-05-13 Process and Form in Geomorphology marks a turning point in geomorphological research Stoddart has brought together a team of the leading international experts to offer important new studies into the processes theory and history of landforms and to present a framework for taking research forward into the new millennium Illustrated throughout Process and Form in Geomorphology takes up the challenges of the research agenda set by Richard Chorley and offers fresh insights into his unique contribution
