D Modules And Spherical Representations Mathematical Notes 39:

D-Modules and Spherical Representations Frédéric V. Bien, 2014-07-14 The theory of D modules deals with the algebraic aspects of differential equations These are particularly interesting on homogeneous manifolds since the infinitesimal action of a Lie algebra consists of differential operators Hence it is possible to attach geometric invariants like the support and the characteristic variety to representations of Lie groups By considering D modules on flag varieties one obtains a simple classification of all irreducible admissible representations of reductive Lie groups On the other hand it is natural to study the representations realized by functions on pseudo Riemannian symmetric spaces i e spherical representations The problem is then to describe the spherical representations among all irreducible ones and to compute their multiplicities This is the goal of this work achieved fairly completely at least for the discrete series representations of reductive symmetric spaces The book provides a general introduction to the theory of D modules on flag varieties and it describes spherical D modules in terms of a cohomological formula Using microlocalization of representations the author derives a criterion for irreducibility The relation between multiplicities and singularities is also discussed at length Originally published in 1990 The Princeton Legacy Library uses the latest print on demand technology to again make available previously out of print books from the distinguished backlist of Princeton University Press These editions preserve the original texts of these important books while presenting them in durable paperback and hardcover editions The goal of the Princeton Legacy Library is to vastly increase access to the rich scholarly heritage found in the thousands of books published by Princeton University Press since its founding in 1905 *Geometry and Representation Theory of Real and p-adic groups* Juan Tirao, David Vogan, Joe Wolf, 2012-12-06 The representation theory of Lie groups plays a central role in both classical and recent developments in many parts of mathematics and physics In August 1995 the Fifth Workshop on Representation Theory of Lie Groups and its Applications took place at the Universidad Nacional de Córdoba in Argentina Organized by Joseph Wolf Nolan Wallach Roberto Miatello Juan Tirao and Jorge Vargas the workshop offered expository courses on current research and individual lectures on more specialized topics The present volume reflects the dual character of the workshop Many of the articles will be accessible to graduate students and others entering the field Here is a rough outline of the mathematical content The editors beg the indulgence of the readers for any lapses in this preface in the high standards of historical and mathematical accuracy that were imposed on the authors of the articles Connections between flag varieties and representation theory for real reductive groups have been studied for almost fifty years from the work of Gelfand and Naimark on principal series representations to that of Beilinson and Bernstein on localization The article of Wolf provides a detailed introduction to the analytic side of these developments He describes the construction of standard tempered representations in terms of square integrable partially harmonic forms on certain real group orbits on a flag variety and outlines the ingredients in the Plancherel formula Finally he describes recent work on the complex geometry of real group

orbits on partial flag varieties **Selected Papers on Harmonic Analysis, Groups, and Invariants** Katsumi Nomizu, 1997 The five papers originally appeared in Japanese in the journal Sugaku and would ordinarily appear in the Society's translation of that journal but are published separately here to expedite their dissemination They explore such aspects as representation theory differential geometry invariant theory and complex analysis No index Member prices are 47 for institutions and 35 for individual Annotation copyrighted by Book News Inc Portland OR **Geometric Aspects of Functional Analysis** Bo'az Klartag, Shahar Mendelson, Vitali D. Gourevitch Masatoshi Kitagawa Salma Nasrin Yoshiaki Oshima and Petr Somberg 2000 The Classical and Quantum 6j-symbols J. Scott Carter, Daniel E. Flath, Masahico Saito, 1995-12-31 Addressing physicists and mathematicians alike this book discusses the finite dimensional representation theory of $sl(2)$ both classical and quantum Covering representations of $U(1)$ quantum $sl(2)$ the quantum trace and color representations and the Turaev Viro invariant this work is useful to graduate students and professionals The classic subject of representations of $U(1)$ is equivalent to the physicists theory of quantum angular momentum This material is developed in an elementary way using spin networks and the Temperley Lieb algebra to organize computations that have posed difficulties in earlier treatments of the subject The emphasis is on the 6j symbols and the identities among them especially the Biedenharn Elliott and orthogonality identities The chapter on the quantum group $U_q(3)$ develops the representation theory in strict analogy with the classical case wherein the authors interpret the Kauffman bracket and the associated quantum spin networks algebraically The authors then explore instances where the quantum parameter q is a root of unity which calls for a representation theory of a decidedly different flavor The theory in this case is developed modulo the trace zero representations in order to arrive at a finite theory suitable for topological applications The Turaev Viro invariant for 3 manifolds is defined combinatorially using the theory developed in the preceding chapters Since the background from the classical quantum and quantum root of unity cases has been explained thoroughly the definition of this invariant is completely contained and justified within the text

Introduction to Ergodic Theory I. A. Grigor'evich Sinai, 1976 Based on lectures in Erevan this exposition of ergodic theory contains a rich collection of examples well chosen to introduce the reader to the main themes of the subject Topics discussed include existence of invariant measures geodesic flows on Riemannian manifolds ergodic theory of an ideal gas and entropy of dynamical systems *Lectures on Hermite and Laguerre Expansions* Sundaram Thangavelu, 1993-05-09 The interplay between analysis on Lie groups and the theory of special functions is well known This monograph deals with the case of the Heisenberg group and the related expansions in terms of Hermite special Hermite and Laguerre functions The main thrust of the book is to develop a concrete Littlewood Paley Stein theory for these expansions and use the theory to prove multiplier theorems The questions of almost everywhere and mean convergence of Bochner Riesz means are also treated Most of the results in this monograph appear for the first time in book form Lie Groups, Lie Algebras, and Cohomology Anthony W. Knap, 1988-05-21 This book starts with the elementary theory of Lie groups of matrices and arrives at the definition elementary properties and first applications of cohomological induction which is a recently discovered algebraic construction of group representations Along the way it develops the computational techniques that are so important in handling Lie groups The book is based on a one semester course given at the State University of New York Stony Brook in fall 1986 to an audience having little or no background in Lie groups but interested in seeing connections among algebra geometry and Lie theory These notes develop what is needed beyond a first graduate course in algebra in

order to appreciate cohomological induction and to see its first consequences Along the way one is able to study homological algebra with a significant application in mind consequently one sees just what results in that subject are fundamental and what results are minor

The Seiberg-Witten Equations and Applications to the Topology of Smooth

Four-manifolds John W. Morgan, 1996 The recent introduction of the Seiberg Witten invariants of smooth four manifolds has revolutionized the study of those manifolds The invariants are gauge theoretic in nature and are close cousins of the much studied SU 2 invariants defined over fifteen years ago by Donaldson On a practical level the new invariants have proved to be more powerful and have led to a vast generalization of earlier results This book is an introduction to the Seiberg Witten invariants The work begins with a review of the classical material on Spin c structures and their associated Dirac operators Next comes a discussion of the Seiberg Witten equations which is set in the context of nonlinear elliptic operators on an appropriate infinite dimensional space of configurations It is demonstrated that the space of solutions to these equations called the Seiberg Witten moduli space is finite dimensional and its dimension is then computed In contrast to the SU 2 case the Seiberg Witten moduli spaces are shown to be compact The Seiberg Witten invariant is then essentially the homology class in the space of configurations represented by the Seiberg Witten moduli space The last chapter gives a flavor for the applications of these new invariants by computing the invariants for most Kahler surfaces and then deriving some basic topological consequences for these surfaces

Elliptic Curves Anthony W. Knap, 1992

An elliptic curve is a particular kind of cubic equation in two variables whose projective solutions form a group Modular forms are analytic functions in the upper half plane with certain transformation laws and growth properties The two subjects elliptic curves and modular forms come together in Eichler Shimura theory which constructs elliptic curves out of modular forms of a special kind The converse that all rational elliptic curves arise this way is called the Taniyama Weil Conjecture and is known to imply Fermat's Last Theorem Elliptic curves and the modular forms in the Eichler Shimura theory both have associated L functions and it is a consequence of the theory that the two kinds of L functions match The theory covered by Anthony Knap in this book is therefore a window into a broad expanse of mathematics including class field theory arithmetic algebraic geometry and group representations in which the coincidence of L functions relates analysis and algebra in the most fundamental ways Developing with many examples the elementary theory of elliptic curves the book goes on to the subject of modular forms and the first connections with elliptic curves The last two chapters concern Eichler Shimura theory which establishes a much deeper relationship between the two subjects No other book in print treats the basic theory of elliptic curves with only undergraduate mathematics and no other explains Eichler Shimura theory in such an accessible manner

Representations of $SU(2,1)$

in Fourier Term Modules Roelof W. Bruggeman, Roberto J. Miatello, 2023-11-06 This book studies the modules arising in Fourier expansions of automorphic forms namely Fourier term modules on $SU(2,1)$ the smallest rank one Lie group with a non

abelian unipotent subgroup It considers the abelian Fourier term modules connected to characters of the maximal unipotent subgroups of $SU(2, 1)$ and also the non abelian modules described via theta functions A complete description of the submodule structure of all Fourier term modules is given with a discussion of the consequences for Fourier expansions of automorphic forms automorphic forms with exponential growth included These results can be applied to prove a completeness result for Poincaré series in spaces of square integrable automorphic forms Aimed at researchers and graduate students interested in automorphic forms harmonic analysis on Lie groups and number theoretic topics related to Poincaré series the book will also serve as a basic reference on spectral expansion with Fourier Jacobi coefficients Only a background in Lie groups and their representations is assumed

The American Mathematical Monthly, 1991 Encyclopaedia of Mathematics Michiel Hazewinkel, 2012-12-06 This ENCYCLOPAEDIA OF MATHEMATICS aims to be a reference work for all parts of mathematics It is a translation with updates and editorial comments of the Soviet Mathematical Encyclopaedia published by Soviet Encyclopaedia Publishing House in five volumes in 1977-1985 The annotated translation consists of ten volumes including a special index volume There are three kinds of articles in this ENCYCLOPAEDIA First of all there are survey type articles dealing with the various main directions in mathematics where a rather fine subdivision has been used The main requirement for these articles has been that they should give a reasonably complete up to date account of the current state of affairs in these areas and that they should be maximally accessible On the whole these articles should be understandable to mathematics students in their first specialization years to graduates from other mathematical areas and depending on the specific subject to specialists in other domains of science engineers and teachers of mathematics These articles treat their material at a fairly general level and aim to give an idea of the kind of problems techniques and concepts involved in the area in question They also contain background and motivation rather than precise statements of precise theorems with detailed definitions and technical details on how to carry out proofs and constructions The second kind of article of medium length contains more detailed concrete problems results and techniques

Stable Modules and the D(2)-Problem F. E. A. Johnson, 2003-09-11 This 2003 book is concerned with two fundamental problems in low dimensional topology Firstly the D(2) problem which asks whether cohomology detects dimension and secondly the realization problem which asks whether every algebraic 2 complex is geometrically realizable The author shows that for a large class of fundamental groups these problems are equivalent Moreover in the case of finite groups Professor Johnson develops general methods and gives complete solutions in a number of cases In particular he presents a complete treatment of Yoneda extension theory from the viewpoint of derived objects and proves that for groups of period four two dimensional homotopy types are parametrized by isomorphism classes of projective modules This book is carefully written with an eye on the wider context and as such is suitable for graduate students wanting to learn low dimensional homotopy theory as well as established researchers in the field
