Hagen, 2009-09-17 For the first time the discipline of modern inorganic chemistry has been systematized according to a plan constructed by a council of editorial advisors and consultants among them three Nobel laureates E O Fischer H Taube and G Wilkinson Rather than producing a collection of unrelated review articles the series creates a framework which reflects the creative potential of this scientific discipline Thus it stimulates future development by identifying areas which are fruitful for further research The work is indexed in a unique way by a structured system which maximizes its usefulness to the reader It augments the organization of the work by providing additional routes of access for specific compounds reactions and other topics *Advances in Organometallic Chemistry*, 1975-08-22 *Advances in Organometallic Chemistry Inorganic*

and Ge(CH₃)₃R Compounds up to Cyclic Alkyl Groups Frank Glockling, 2013-06-29 The present volume opens the Gmelin series on organogermanium compounds that is those compounds containing at least one germanium to carbon bond This whole series is being coordinated by Professor J Satge of the Universite Paul Sabatier in Toulouse Germanium is of historical interest because its existence was predicted by Newlands in 1864 and by Mendeleeff in 1871 although it was not isolated until 1887 by Winkler Mendeleeff's predictions of the properties of germanium and its compounds by comparison with what was known of the chemistry of its neighbors silicon and tin proved remarkably accurate and included predictions of the existence of organic derivatives GeR and of their properties 4 Although significant applications are as yet lacking for organogermanium compounds in contrast to organo silicon tin and lead compounds there has been considerable interest in the parallel development of its chemistry Up to 1983 about 1500 publications have appeared on organogermanium chemistry The material of the present series will be grouped in a similar way as for the organotin series beginning with compounds containing only one germanium atom mononuclear compounds and continuing with binuclear up to polynuclear compounds Within each group the compounds are arranged by the kind of non carbon substituents rather than by following the usual Gmelin principle of the last position using the Gmelin system of elements *Inorganic and Bio-Inorganic Chemistry - Volume I* Ivano Bertini, 2009-02-10 Inorganic and Bio Inorganic Chemistry is the component of Encyclopedia of Chemical

Advances in Linear Free Energy Relationships N. Chapman, 2012-12-06 Louis P Hammett Mitchell Professor Emeritus of Chemistry Columbia University My interest in linear free energy relationships began when just out of graduate school I read in 1924 the article by Bmsted and Pedersen which for the first time reported the existence of such a relationship That interest continues to be an active one and to judge merely by the extensive bibliographies contained in the present volume it is widely shared To my mind a particularly happy aspect of the existence of linear free energy relationships has been the proof it supplies that one need not suppose that the behavior of nature is hopelessly complicated merely because one cannot find a theoretical reason for supposing it to be otherwise The effect of a substituent in an organic molecule on rate or equilibrium of reaction involves a fourfold difference between relatively large quantities a situation which always makes for difficult theory Yet systematic organic chemistry could hardly have existed were it not true that like changes in structure lead to like changes in reactivity Linear free energy relationships constitute the quantitative specialisation of this fundamental principle and they stand indeed more in the office of teacher to theory than in that of learner from it

Ni Organonickel Compounds Peter W. Jolly, 2013-11-11 This volume starts the updating of the information on organonickel chemistry one of the most active areas of modern organometallic chemistry It covers all mononuclear compounds containing one nickel to carbon bond The main part is devoted to the family of planar Ni(II) compounds $RNi(D)X_2$ which within 20 years has increased from about 250 to more than 1000 members This research interest has been stimulated by the fact that many compounds insert various unsaturated species into the Ni-C bond to create new organonickel species Moreover these compounds are important as intermediates in many catalytic processes involving organic halides Compounds containing η^2 bonded heteroalkene molecules including the C1 fragments CO₂ and CS₂ and related metallocyclic compounds are also emphasized in this volume These types of compounds play an important role in a number of nickel catalyzed co-oligomerization reactions involving unsaturated organic compounds Most of the compounds are well characterized by modern spectroscopic techniques The various types of compounds are in most cases confirmed by X-ray diffraction The author of these volumes a member of the Mülheim group has made many contributions of his own and is eminently qualified to critically review this area of research
