A. Meyers, M Sarikaya, R. O. Ritchie, 2003-12-05 The importance of the nanoscale effects has been recognized in materials research for over fifty years but it is only recently that advanced characterization and fabrication methods are enabling scientists to build structures atom by atom or molecule by molecule The understanding and control of the nanostructure has been to a large extent made possible by new atomistic analysis and characterization methods pioneered by transmission electron microscopy Nano and Microstructural Design of Advanced Materials focuses on the effective use of such advanced analysis and characterization techniques in the design of materials Teaches effective use of advanced analysis and characterization methods at an atomistic level Contains many supporting examples of materials in which such design concepts have been successfully applied **Microstructural Design of Advanced Engineering Materials** Dmitri A. Molodov, 2013-07-17 The choice of a material for a certain application is made taking into account its properties If for example one would like to produce a table a hard material is needed to guarantee the stability of the product but the material should not be too hard so that manufacturing is still as easy as possible in this simple example wood might be the material of choice When coming to more advanced applications the required properties are becoming more complex and the manufacturer s desire is to tailor the properties of the material to fit the needs To let this dream come true insights into the microstructure of materials is crucial to finally control the properties of the materials because the microstructure determines its properties Written by leading scientists in the field of microstructural design of engineering materials this book focuses on the evolution and behavior of granular microstructures of various advanced materials during plastic deformation and treatment at elevated temperatures These topics provide essential background and practical information for materials scientists metallurgists and solid state physicists **High Entropy Alloys - Composition and Microstructure Design** , 2025-03-26 High entropy alloys HEAs

Alloy Design and Process Innovations Prashanth Konda Gokuldoss,Zhi Wang,2020-04-15 Additive manufacturing AM is one of the manufacturing processes that warrants the attention of industrialists researchers and scientists because of its ability to produce materials with a complex shape without theoretical restrictions and with added functionalities There are several advantages to employing additive manufacturing as the primary additive manufacturing process However there exist several challenges that need to be addressed systematically A couple such issues are alloy design and process development Traditionally alloys designed for conventional cast powder metallurgical processes were fabricated using advanced AM processes This is the wrong approach considering that the alloys should be coined based on the process characteristics and meta stable nature of the process Hence we must focus on alloy design and development for AM that suits the AM processes The AM processes however improve almost every day either in terms of processing capabilities or processing conditions Hence the processing part warrants a section that is devoted to these advancements and innovations Accordingly the present Special Issue book focuses on two aspects of alloy development and process innovations Here 45 articles are presented covering different AM processes including selective laser melting electron beam melting laser cladding direct metal laser sintering ultrasonic consolidation wire arc additive manufacturing and hybrid manufacturing I believe that this Special Issue bears is vital to the field of AM and will be a valuable addition

Metallurgy and Design of Alloys with Hierarchical Microstructures Krishnan K. Sankaran,Rajiv S. Mishra,2017-06-14 Metallurgy and Design of Alloys with Hierarchical Microstructures covers the fundamentals of processing microstructure property relationships and how multiple properties are balanced and optimized in materials with hierarchical microstructures widely used in critical applications The discussion is based principally on metallic materials used in aircraft structures however because they have sufficiently diverse microstructures the underlying principles can easily be extended to other materials systems With the increasing microstructural complexity of structural materials it is important for students academic researchers and practicing engineers to possess the knowledge of how materials are optimized and how they will

behave in service The book integrates aspects of computational materials science physical metallurgy alloy design process design and structure properties relationships in a manner not done before It fills a knowledge gap in the interrelationships of multiple microstructural and deformation mechanisms by applying the concepts and tools of designing microstructures for achieving combinations of engineering properties such as strength corrosion resistance durability and damage tolerance in multi component materials used for critical structural applications Discusses the science behind the properties and performance of advanced metallic materials Provides for the efficient design of materials and processes to satisfy targeted performance in materials and structures Enables the selection and development of new alloys for specific applications based upon evaluation of their microstructure as illustrated in this work

Alloy Design and Characterization of γ' Strengthened Nickel-based Superalloys for Additive Manufacturing Jinghao Xu, 2021-01-28 Nickel based superalloys an alloy system bases on nickel as the matrix element with the addition of up to 10 more alloying elements including chromium aluminum cobalt tungsten molybdenum titanium and so on Through the development and improvement of nickel based superalloys in the past century they are well proved to show excellent performance at the elevated service temperature Owing to the combination of extraordinary high temperature mechanical properties such as monotonic and cyclic deformation resistance fatigue crack propagation resistance and high temperature chemical properties such as corrosion and oxidation resistance phase stability nickel based superalloys are widely used in the critical hot section components in aerospace and energy generation industries The success of nickel based superalloy systems attributes to both the well tailored microstructures with the assistance of carefully doped alloying elements and the intently developed manufacturing processes The microstructure of the modern nickel based superalloys consists of a two phase configuration the intermetallic precipitates Ni Co 3 Al Ti Ta known as phase dispersed into the austenite matrix which is firstly introduced in the 1940s The recently developed additive manufacturing AM techniques acting as the disruptive manufacturing process offers a new avenue for producing the nickel based superalloy components with complicated geometries However strengthened nickel based superalloys always suffer from the micro cracking during the AM process which is barely eliminated by the process optimization On this basis the new compositions of strengthened nickel based superalloy adapted to the AM process are of great interest and significance This study sought to design novel strengthened nickel based superalloys readily for AM process with limited cracking susceptibility based on the understanding of the cracking mechanisms A two parameter model is developed to predict the additive manufacturability for any given composition of a nickel based superalloy One materials index is derived from the comparison of the deformation resistant capacity between dendritic and interdendritic regions while another index is derived from the difference of heat resistant capacity of these two spaces By plotting the additive manufacturability diagram the superalloys family can be categorized into the easy to weld fairly weldable and non weldable regime with the good agreement of the existed knowledge To design a novel superalloy a Cr

Co Mo W Al Ti Ta Nb Fe Ni alloy family is proposed containing 921 600 composition recipes in total Through the examination of additive manufacturability undesired phase formation propensity and the precipitation fraction one composition of superalloy MAD542 out of the 921 600 candidates is selected Validation of additive manufacturability of MAD542 is carried out by laser powder bed fusion LPBF By optimizing the LPBF process parameters the crack free MAD542 part is achieved In addition the MAD542 superalloy shows great resistance to the post processing treatment induced cracking During the post processing treatment extensive annealing twins are promoted to achieve the recrystallization microstructure ensuring the rapid reduction of stored energy After ageing treatment up to 60 65% volume fraction of precipitates are developed indicating the huge potential of formation Examined by the high temperature slow strain rate tensile and constant loading creep testing the MAD542 superalloy shows superior strength than the LPBF processed and hot isostatic pressed plus heat treated IN738LC superalloy While the low ductility of MAD542 is existed which is expected to be improved by modifying the post processing treatment scenarios and by the adjusting building direction in the following stages of the Ph D research MAD542 superalloy so far shows both good additive manufacturability and mechanical potentials Additionally the results in this study will contribute to a novel paradigm for alloy design and encourage more strengthened nickel based superalloys tailored for AM processes in the future
