Who's Who in Fluorescence 2005 Chris D. Geddes,Joseph R. Lakowicz,2007-12-24 The Who s Who in Fluorescence 2005 is the 3r volume of the Who s who series The previous two volumes 2003 and 2004 have been very well received indeed with many copies being distributed around the world through conferences and workshops as well as through internet book sites In the last 2 years a great many of you have sent comments and suggestions we thank you all We have tried to accommodate many of these into the new 2005 volume This new 2005 volume features some 382 entries from no fewer than 32 countries an increase from 312 entries in the 2003 volume In addition we have a continued strong company support which will enable us to further disseminate the volume in 2005 In this regard we especially thank the instrumentation companies for their continued support where without their finical contributions it is likely that the volume would not be the success it is today We have introduced a new author publication statistic into this volume the Author Impact Measure AIM number While voluntary this number is intended to reflect an author s progress in past years The AIM number simply summates the impact number from the ISI database of Journals published in in that year multiplied by the frequency of those publications From those who chose to participate we

can see most impressive AIM numbers in some instances greater than 80 for an individual year

Fluctuation Theory of Solutions Paul E. Smith, Enrico Matteoli, John P. O' Connell, 2013-02-22 There are essentially two theories of solutions that can be considered exact the McMillan Mayer theory and Fluctuation Solution Theory FST The first is mostly limited to solutes at low concentrations while FST has no such issue It is an exact theory that can be applied to any stable solution regardless of the number of components and their concentrations and the types of molecules and their sizes

Fluctuation Theory of Solutions Applications in Chemistry Chemical Engineering and Biophysics outlines the general concepts and theoretical basis of FST and provides a range of applications described by experts in chemistry chemical engineering and biophysics The book which begins with a historical perspective and an introductory chapter includes a basic derivation for more casual readers It is then devoted to providing new and very recent applications of FST The first application chapters focus on simple model binary and ternary systems using FST to explain their thermodynamic properties and the concept of preferential solvation Later chapters illustrate the use of FST to develop more accurate potential functions for simulation describe new approaches to elucidate microheterogeneities in solutions and present an overview of solvation in new and model systems including those under critical conditions Expert contributors also discuss the use of FST to model solute solubility in a variety of systems The final chapters present a series of biological applications that illustrate the use of FST to study cosolvent effects on proteins and their implications for protein folding With the application of FST to study biological systems now well established and given the continuing developments in computer hardware and software increasing the range of potential applications FST provides a rigorous and useful approach for understanding a wide array of solution properties This book outlines those approaches and their advantages across a range of disciplines elucidating this robust practical theory

Introduction to Fluorescence Sensing Alexander P. Demchenko, 2008-12-21 Fluorescence sensing is a rapidly developing field of research and technology Its target is nearly the whole world of natural and synthetic compounds being detected in different media including living bodies The application area range from control of industrial processes to environment monitoring and clinical diagnostics Among different detection methods fluorescence techniques

are distinguished by ultimate sensitivity high temporal and spatial resolution and versatility that allows not only remote detection of different targets but their imaging within the living cells The basic mechanism of sensing is the transmission of the signal produced by molecular interaction with the target to fluorescent molecules nanoparticles and nanocomposites with the detection by devices based on modern electronics and optics In this interdisciplinary field of research and development the book is primarily intended to be a guide for students and young researchers It is also addressed to professionals involved in active research and product development serving as a reference for the recent achievements The users of these products will find description of principles that could allow proper selection of sensors for particular needs Making a strong link between education research and product development this book discusses future directions

Applications of

Calorimetry in a Wide Context Amal Ali Elkordy, 2013-01-23 Calorimetry as a technique for thermal analysis has a wide range of applications which are not only limited to studying the thermal characterisation e g melting temperature denaturation temperature and enthalpy change of small and large drug molecules but are also extended to characterisation of fuel metals and oils Differential Scanning Calorimetry is used to study the thermal behaviours of drug molecules and excipients by measuring the differential heat flow needed to maintain the temperature difference between the sample and reference cells equal to zero upon heating at a controlled programmed rate Microcalorimetry is used to study the thermal transition and folding of biological macromolecules in dilute solutions Microcalorimetry is applied in formulation and stabilisation of therapeutic proteins This book presents research from all over the world on the applications of calorimetry on both solid and liquid states of materials
