Peh, Richard T. Corlett, Yves Bergeron, 2024-10-07 The Routledge Handbook of Forest Ecology is an

essential resource covering all aspects of forest ecology from a global perspective This new edition has been fully revised and updated throughout to reflect the profound and unprecedented changes in both forests and climates since the publication of the first edition in 2015 The handbook reflects key developments in the field of forest dynamics and large scale processes as well as the changes that are now manifesting in different types of forests across the globe as a result of climate change It covers both natural and managed forests from boreal temperate sub tropical and tropical regions of the world In this second edition the breadth of the handbook has been expanded with new chapters on mountain forests monodominance pathogens and invertebrate pests and amphibians and reptiles in forest ecosystems Original author teams are complemented by the addition of new authors to offer fresh perspectives and the second edition places greater emphasis on the applicability of each topic at a global level The handbook is divided into seven parts Part I The forest Part II Forest dynamics Part III Forest flora and fauna Part IV Energy and nutrients Part V Forest conservation and management Part VI Forest and climate change Part VII Human ecology The Routledge Handbook of Forest Ecology is an essential reference text for a wide range of students and scholars of ecology environmental science forestry geography and natural resource management

Plant Ecology Michael J. Crawley, 2009-06-22 Plant ecology is the scientific study of the factors influencing the distribution and abundance of plants This benchmark text extremely well received in its first edition shows how pattern and structure at different levels of plant organization from ecophysiology through population dynamics to community structure and ecosystem function are influenced by abiotic factors eg climate and soils and by biotic factors eg competition and herbivory Adopting a dynamic approach this book combines descriptive text with theoretical models and experimental data It will be invaluable reading for both student and practising ecologist alike In this second edition the structure of the book has been completely revised moving from the small scale to the large scale in keeping with contemporary teaching methods This fresh approach allows consideration of several new and important topics such as plant secondary chemistry herbivory sex and breeding systems Additional chapters address topical applied issues in plant ecology including global warming pollution and biodiversity The latest edition of a very widely adopted textbook Written by a team of leading experts and edited by an international authority in the field

Degraded Forests in Eastern Africa Frans Bongers, Timm Tennigkeit, 2010-09-23 Forest degradation as a result of logging shifting cultivation agriculture and urban development is a major issue throughout the tropics It leads to loss in soil fertility water resources and biodiversity as well as contributes to climate change Efforts are therefore required to try to minimize further degradation and restore tropical forests in a sustainable way This is the first research based book to examine this problem in East Africa The specific focus is on the forests of Ethiopia Tanzania and Uganda but the lessons learned are shown to be applicable to neighbouring countries and others in the tropics A wide range of forest types are covered from dry Miombo forest and afro-montane forests to forest savannah mosaics and wet forest types Current management practices are assessed and examples of good practice presented The role of local people is also

emphasized The authors describe improved management and restoration through silviculture plantation forestry and agroforestry leading to improvements in timber production biodiversity conservation and the livelihoods of local people A *Handbook of Global Freshwater Invasive Species* Robert A. Francis, 2012-03-12 Invasive non native species are a major threat to global biodiversity Often introduced accidentally through international travel or trade they invade and colonize new habitats often with devastating consequences for the local flora and fauna Their environmental impacts can range from damage to resource production e g agriculture and forestry and infrastructure e g buildings road and water supply to human health They consequently can have major economic impacts It is a priority to prevent their introduction and spread as well as to control them Freshwater ecosystems are particularly at risk from invasions and are landscape corridors that facilitate the spread of invasives This book reviews the current state of knowledge of the most notable global invasive freshwater species or groups based on their severity of economic impact geographic distribution outside of their native range extent of research and recognition of the ecological severity of the impact of the species by the IUCN As well as some of the very well known species the book also covers some invasives that are emerging as serious threats Examples covered include a range of aquatic and riparian plants insects molluscs crustacea fish amphibians reptiles and mammals as well as some major pathogens of aquatic organisms The book also includes overview chapters synthesizing the ecological impact of invasive species in fresh water and summarizing practical implications for the management of rivers and other freshwater habitats

Diversity of Ecosystems Mahamane Ali, 2012-04-27 The ecosystems present a great diversity worldwide and use various functionalities according to ecologic regions In this new context of variability and climatic changes these ecosystems undergo notable modifications amplified by domestic uses of which it was subjected to Indeed the ecosystems render diverse services to humanity from their composition and structure but the tolerable levels are unknown The preservation of these ecosystemic services needs a clear understanding of their complexity The role of research is not only to characterise the ecosystems but also to clearly define the tolerable usage levels Their characterisation proves to be important not only for the local populations that use it but also for the conservation of biodiversity Hence the measurement management and protection of ecosystems need innovative and diverse methods For all these reasons the aim of this book is to bring out a general view on the function of ecosystems modelling sampling strategies invading species the response of organisms to modifications the carbon dynamics the mathematical models and theories that can be applied in diverse conditions
