Bone Toxicology Susan Y. Smith, Aureore Varela, Rana Samadfam, 2017-09-27
The content of this book is intended to provide the toxicologist in drug development in the pharmaceutical and biotechnology industries with a broad understanding of bone and its interactions with other organ systems in safety assessments The book is divided into three parts The first part describes our current understanding of bone biology and its primary regulatory pathways Additional chapters address regulatory and study design considerations for incorporating bone end points in toxicology studies with special consideration being given to juvenile toxicology studies This is intended to address recent regulatory requirements to evaluate skeletal development for drugs in development for pediatric populations The second part of the book describes the principal techniques and methods used in bone research understanding how these end points are derived is fundamental to their appropriate application These first two parts of the book provide the background and the means to develop the concepts in part three which describes bone and its interaction with other organ systems The unique series of chapters in part three contributed to by key leaders in their respective fields and in bone research provides a comprehensive collective work Although constantly evolving the crosstalk and interaction of the skeleton with several organ systems is now recognized and well documented such as for the reproductive system muscle and kidney while our understanding of the interaction with other organ systems such as the immune system and CNS is in its infancy Recent work highlights the key role of the skeleton in the regulation of energy metabolism and the impact this has on research in metabolic diseases such as obesity and diabetes The hope is that this book will enlighten many and encourage more to explore the impact of new

compounds on the skeleton in the development of effective and safe drugs

Neil Garland, 2012-12-06 The examination of excavated human bone finds is mainly the domain of anthropologists and forensic pathologists the former working with ancient and historical specimens the latter with modern finds The methodological and diagnostic approaches to these skeletal finds are the same regardless of the time of burial For physical anthropology bodily human relics are dealt with as historical resources which give clues to ancient population structure population development life style and subsistence They are thus able to help scientists understand the present state of human populations The identification of the finds whether species diagnosis or the evaluation of individual parameters such as sex age at death body size and shape kinship and pathology follows the same procedure used by forensic pathologists whose task is the identification of bodily relics in cases of crime mass disaster and the like However there are other disciplines which benefit from excavated bone finds Anatomy gains insights into the morphological variability of the skeleton in time and place The implications for modern physicians and pathologists are at least two fold pathological specimens are suitable to unravel the distribution of many diseases and the susceptibility of individuals to pathogens in pre antibiotic populations In addition to this epidemiological aspect exhumed specimens often exhibit advanced states of bone disease which are no longer or only very rarely present in today's industrialized populations because of efficient surgical intervention and pharmacological treatment *Bone Histology* Christian Crowder, Sam Stout, 2011-09-22 A broad understanding of bone and tooth microstructure is necessary for constructing the biological profile of an individual or individuals within a population Bone Histology An Anthropological Perspective brings together authors with extensive experience and expertise in various aspects of hard tissue histology to provide a comprehensive discussion of the application of methods current theories and future directions in hard tissue research related to anthropological questions Topics discussed include The biology underlying skeletal growth and development leading to adult skeletal morphology Current research in understanding bone modeling Histological features of dental hard tissues and their utility in biological anthropology Histological analysis as a means to differentiate human from nonhuman bone and for the purpose of age estimation The biomechanics of cortical bone Histotaphonomy and how postmortem microstructural change can be used for taphonomic inquiry The application of light microscopy in paleopathology to classify pathological conditions The histological study of bone tissue of archaeological origin Researchers

access to collections of bone samples with known demographic information Technological aspects of hard tissue histology including laboratory requirements and high resolution imaging In most cases the physical remains of humans available to bioarchaeologists paleopathologists and paleontologists are limited to skeletal material Fortunately these hard tissues are a storehouse of information about biological processes experienced during the life of an individual This volume provides an overview of the current state of research and potential applications in anthropology and other fields that employ a histological approach to the study of hard tissues

Bone Loss and Osteoporosis Sabrina C. Agarwal, Samuel D. Stout, 2011-06-28 With the growing incidence of fragility fractures in Europe and North America over the last three decades bone loss and osteoporosis have become active areas of research in skeletal biology Bone loss is associated with aging in both sexes and is accelerated in women with the onset of menopause However bone loss is related to a suite of complex and often synergistically related factors including genetics pathology nutrition mechanical usage and lifestyle It is not surprising that its incidence and severity vary among populations There has been increasing interest to investigate bone loss and osteoporosis from an anthropological perspective that utilizes a biocultural approach Biocultural approaches recognize the inter relationship between biological cultural and environmental variables Anthropological studies also highlight the value of evolutionary and population approaches to the study of bone loss These approaches are particularly suited to elucidate the multifactorial etiology of bone loss The idea for this volume came out of a symposium organized by the editors at the 70th annual meeting of The American Association of Physical Anthropologists in Kansas City Missouri Many of the symposium participants along with several additional leading scientists involved in bone and osteoporosis research are brought together in this volume Each chapter focuses on a different aspect of bone loss and fragility with a fresh and stimulating perspective
