Gaastra, 2012-12-06 The last few years have seen the rapid development of new methodology in the field of molecular biology. New techniques have been regularly introduced and the sensitivity of older techniques greatly improved upon. Developments in the field of genetic engineering, in particular, have contributed a wide range of new techniques. The purpose of this book therefore is to introduce the reader to a selection of the more advanced analytical and preparative techniques which the editors consider to be frequently used by research workers in the field of molecular biology. In choosing techniques for this book we have obviously had to be selective and for the sake of brevity a knowledge of certain basic biochemical techniques and terminology has been assumed. However, since many areas of molecular biology are developing at a formidable rate and constantly generating new terminology, a glossary of terms has been included. The techniques chosen for this book are essentially based on those used in a series of workshops on techniques in molecular biology that have been held at The Hatfield Polytechnic in recent years. In choosing these chapters we have taken into account many useful suggestions and observations made by participants at these workshops. Each chapter aims to describe both the theory and relevant practical details for a given technique and to identify both the potential and limitations of the technique. Each chapter is written by authors who regularly use the technique in their own laboratories.     **Methods in Virology** Karl Maramorosch, Hilary Koprowski, 2014-06-28 Methods in Virology Volume VII focuses on the methods used in virology including radioimmunoassays, microscopy, hybridization, and mutagenesis. The selection first elaborates on monoclonal antibody techniques applied to viruses, competition radioimmunoassays for characterization of antibody reactions to viral antigens, and enzyme immunoassays in plant virology. Discussions focus on the principles of enzyme immunoassay, choice of enzyme, and preparation of conjugate, determination of

immunoglobulin class and maintenance and specificity testing of hybridomas The text then elaborates on electron microscopy for the identification of plant viruses in in vitro preparations and cloning and expression of viral antigens in Escherichia coli and other microorganisms including influenza virus expression of foreign coding sequences in Escherichia coli hepatitis B virus electron microscope immunoelectron microscopy and imaging of nucleic acids The manuscript takes a look at the detection and characterization of subgenomic RNA in plant viruses exploring the gene organization of baculoviruses and spot hybridization for detection of viroids and viruses Topics include application to viral diseases mapping mutations of baculoviruses transcriptional mapping of baculovirus genomes and genetic mapping by blot hybridization The selection is a valuable source of information for researchers interested in the methods employed in virology

*Ultrahigh Vacuum Metalorganic Chemical Vapor Deposition and in Situ Characterization of Nanoscale Titanium Dioxide Films* Polly Wanda Chu, 1994 Thin titanium dioxide films were produced by metalorganic chemical vapor deposition on sapphire 0001 in an ultrahigh vacuum UHV chamber A method was developed for producing controlled submonolayer depositions from titanium isopropoxide precursor Film thickness ranged from 0.1 to 2.7 nm In situ X ray photoelectron spectroscopy XPS was used to determine film stoichiometry with increasing thickness The effect of isothermal annealing on desorption was evaluated Photoelectron peak shapes and positions from the initial monolayers were analyzed for evidence of interface reaction Deposition from titanium isopropoxide is divided into two regimes depositions below and above the pyrolysis temperature This temperature was determined to be 300 deg C Controlled submonolayers of titanium oxide were produced by cycles of dosing with titanium isopropoxide vapor below and annealing above 300 deg C Precursor adsorption below the pyrolysis temperature was observed to saturate after 15 minutes of dosing The quantity absorbed was shown to have an upper limit of one monolayer The stoichiometry of thin films grown by the cycling method were determined to be TiO<sub>2</sub> Titanium dioxide film stoichiometry was unaffected by isothermal annealing at 700 deg C Annealing produced a decrease in film thickness This was explained as due to desorption Desorption ceased at approximately 2.5 to 3 monolayers suggesting bonding of the initial monolayers of film to sapphire is stronger than to itself Evidence of sapphire reduction at the interface by the depositions was not observed The XPS O 1s peak shifted with increased film thickness The shifts were consistent with oxygen in sapphire and titanium dioxide having different O 1s photoelectron peak positions Simulations showed the total shifts for thin films ranging in thickness of 0.1 to 2.7 nm to be 0.99 to 1.23 eV Thick films were produced for comparison
