Coupled Models For The Hydrological Cycle Integrating Atmosphere Biosphere And Pedosphere:

Coupled Models for the Hydrological Cycle Axel Bronstert, Jesus Carrera, Pavel Kabat, Sabine Lütkeemeier, 2005-08-29 Hydrologists climatologists soil scientists and environmental engineers are frequently asked to analyse complex environmental problems It is becoming increasingly apparent that these problems usually involve feedbacks between atmospheric ecological and hydrological systems as well as human society It is often the feedbacks between systems that are of greatest interest because they may produce unanticipated responses That is why coupling of different compartments of the Earth system has emerged as a general challenge to the modelling community This book considers an array of state of the art coupling and modelling concepts First the relevant Earth system cycles are presented followed by a discussion on scale issues and multiple equilibria Inter and intra compartmental coupling is addressed along with a debate on non linearities and questions of parameterisation Several applications are presented where a focus is on cases where the hydrological cycle plays a central role

Environmental Management of River Basin Ecosystems Mu. Ramkumar, K Kumaraswamy, R. Mohanraj, 2015-02-18 This book offers a unique collection of inter and multidisciplinary studies on river systems Rivers have been the prime source of sustenance since the advent of civilization and river systems often form the basis for agriculture transport water and land for domestic commercial and industrial activities fostering economic prosperity A river basin is a basic geographical and climatological unit within which the vagaries of natural processes act and manifest themselves at different spatio temporal scales Even if compared side by side no two river basins respond to natural processes in the same way and thus it has long been recognized that each river basin is unique Hence any developmental activity or conservation effort has to be designed and implemented to match each unique river basin With the burgeoning population and increasing dependency on natural resources understanding and maintaining river systems has become increasingly important This book provides a varied reference work on and unprecedented guidelines for conducting and implementing research on river basins and for managing their ecological development

Surface, Sub-Surface Hydrology and Management Subodh Chandra Pal, Uday Chatterjee, 2025-03-19 This book explores the surface and subsurface hydrological conditions and their management in a tropical or sub tropical setting applying geospatial and geostatistical derived predictive methods The book is a research of the surface and subsurface hydrological processes as a result of over exploitation for agricultural production and irrigation which resulted in a significant drop in water even during pre monsoon period and a charge up study to control surface and

subsurface water scarcity Recent and expected trends indicate that future water challenges will become more complex Over exploitation of groundwater and surface water scarcity are posing an increasing threat to food security and rural livelihood stability Understanding the features of groundwater and surface water and how they interact with the environment population and social aspects is a difficult challenge for researchers they must provide guidance for sustainable resource management while balancing economic efficiency and ecological health This book stands out for its focus on using geospatial and geostatistical methods to tackle practical issues The chapters demonstrate how advanced analytical tools can be used to extract useful insights from complex hydrological datasets such as mapping surface water flow patterns and delineating groundwater contamination plumes Additionally including case studies from various geographic areas offers readers a worldwide view on hydrological challenges and approaches to managing them This book acts as a catalyst for more research and dialogue in the areas of Environmental Sciences Geography Hydrology Natural Hazards Geospatial Sciences Remote Sensing GIS Agriculture Crop Science Forestry Soil Science Agronomy Humanistic Social Sciences etc promoting organization in the field of surface and sub surface hydrology We aim to advance scientific knowledge and promote sustainable water resource management by combining expertise from various disciplines and highlighting the potential of geospatial and geostatistical techniques

Regional Hydrological Impacts of Climatic Change: Impact assessment and decision making Thorsten Wagener, Stewart W. Franks, 2005 Hydrometeorology Christopher G. Collier, 2016-08-08 Hydrometeorology presents an introduction to relevant topics in the interdisciplinary fields of hydrology and meteorology This book is one of the few books aiming to provide a balance between aspects of meteorological and hydrological processes The transfer of energy and water between the land surface and lower atmosphere within the hydrological cycle is addressed followed by a description of the nature of precipitation and how it is formed Forecasting precipitation is reviewed on all scales and the range of rainfall runoff models and coastal surge models and forecasts including tsunamis which have been and are being used are discussed The mechanisms of snow ice glacier sea and tundra evaporation and transpiration how drought occurs and the representation of wind are described How rainfall including radar measurements and river flow information is gathered and analysed including frequency analysis Probable Maximum Precipitation and Flood are presented Satellite measurements of precipitation are discussed Examples of major past floods and droughts are given Past and future climate change which is included underpins the importance of hydro meteorological processes The structure of the general circulation of the atmosphere and how it influences weather and climate including the Hadley Ferrel and Polar cells the Trade winds and the El Nino is outlined Finally the influence of urban areas on rainfall formation dealing with urban drainage and air quality are described Each chapter ends with one or two specific points as appendices elements discussed in the chapter and a list of sample problems to aid understanding Readership This book is aimed at 3rd year undergraduate and postgraduate students on hydrology hydrometeorology environmental science and geography courses Professionals in

environmental protection agencies and consultancies will also find the book of great interest It contains a balance of both the physics and mathematics which underpin such courses and activities

Environmental Modeling Ekkehard Holzbecher, 2012-01-10 The book has two aims to introduce basic concepts of environmental modelling and to facilitate the application of the concepts using modern numerical tools such as MATLAB It is targeted at all natural scientists dealing with the environment process and chemical engineers physicists chemists biologists biochemists hydrogeologists geochemists and ecologists MATLAB was chosen as the major computer tool for modeling firstly because it is unique in its capabilities and secondly because it is available in most academic institutions in all universities and in the research departments of many companies In the 2nd edition many chapters will include updated and extended material In addition the MATLAB command index will be updated and a new chapter on numerical methods will be added For the second edition of Environmental Modeling the first edition was completely revised Text and figures were adapted to the recent MATLAB version Several chapters were extended Correspondingly the index of MATLAB commands was extended considerably which makes the book even more suitable to be used as a reference work by novices Finally an introduction into numerical methods was added as a new chapter p

Geological Storage of CO₂ in Deep Saline Formations Auli Niemi, Jacob Bear, Jacob Bensabat, 2017-02-24 This book offers readers a comprehensive overview and an in depth understanding of suitable methods for quantifying and characterizing saline aquifers for the geological storage of CO₂ It begins with a general overview of the methodology and the processes that take place when CO₂ is injected and stored in deep saline water containing formations It subsequently presents mathematical and numerical models used for predicting the consequences of CO₂ injection This book provides descriptions of relevant experimental methods from laboratory experiments to field scale site characterization and techniques for monitoring spreading of the injected CO₂ within the formation Experiences from a number of important field injection projects are reviewed as are those from CO₂ natural analog sites Lastly the book presents relevant risk management methods Geological storage of CO₂ is widely considered to be a key technology capable of substantially

reducing the amount of CO₂ released into the atmosphere thereby reducing the negative impacts of such releases on the global climate Around the world projects are already in full swing while others are now being initiated and executed to demonstrate the technology Deep saline formations are the geological formations considered to hold the highest storage potential due to their abundance worldwide To date however these formations have been relatively poorly characterized due to their low economic value Accordingly the processes involved in injecting and storing CO₂ in such formations still need to be better quantified and methods for characterizing modeling and monitoring this type of CO₂ storage in such formations must be rapidly developed and refined

New Permafrost and Glacier Research Max I. Krugger,2009 In geology permafrost or permafrost soil is soil at or below the freezing point of water 0 C or 32 F for two or more years Ice is not always present as may be in the case of nonporous bedrock but it frequently occurs and it may be in amounts exceeding the potential hydraulic saturation of the ground material Most permafrost is located in high latitudes i e land in close proximity to the North and South poles but alpine permafrost may exist at high altitudes in much lower latitudes The extent of permafrost can vary as the climate changes Today approximately 20% of the Earth s land mass is covered by permafrost including discontinuous permafrost or glacial ice A glacier is a large slow moving mass of ice formed from compacted layers of snow that slowly deforms and flows in response to gravity and high pressure The word glacier comes from French via the Vulgar Latin glacia and ultimately from Latin glacies meaning ice Glacier ice is the largest reservoir of fresh water on Earth and second only to oceans as the largest reservoir of total water Glaciers cover vast areas of polar regions are found in mountain ranges of every continent and are restricted to the highest mountains in the tropics The processes and landforms caused by glaciers and related to them are referred to as glacial The process of glacier growth and establishment is called glaciation Glaciers are sensitive monitors of climate conditions and are crucial to both world water resources and sea level variation This book presents the latest research on both permafrost and glaciers
