Computational Intelligence in Telecommunications Networks Witold Pedrycz, Athanasios Vasilakos, 2018-10-03
Telecommunications has evolved and grown at an explosive rate in recent years and will undoubtedly continue to do so. As its functions, applications, and technology grow, it becomes increasingly complex and difficult, if not impossible, to meet the demands of a global network using conventional computing technologies. Computational intelligence (CI) is the technology of the future, and the future is now. Computational Intelligence in Telecommunications Networks offers an in-depth look at the rapid progress of CI technology and shows its importance in solving the crucial problems of future telecommunications networks. It covers a broad range of topics from Call Admission Control, congestion control, and QoS routing for ATM networks to network design and management, optical mobile, and active networks, and Intelligent Mobile Agents. Today's telecommunications professionals need a working knowledge of CI to exploit its potential to overcome emerging challenges. The CI community must become acquainted with those challenges to take advantage of the enormous opportunities the telecommunications field offers. This text meets both those needs clearly, concisely, and with a depth certain to inspire further theoretical and practical advances.

Ruggieri,2012-12-06 This book of Proceedings contains papers of the Third European Workshop on Mobile Personal Satcoms EMPS 98 held in Venice Italy November 1998 For the third time EMPS has given to the experts an opportunity for exchanging opinions and novel ideas in the exciting field of mobile and personal satellite communications As with the 1996 edition EMPS 98 issued a formal call for papers gathering a large number of contributions from many different countries

Each submitted paper has been reviewed by international referees and finally selected by the Workshop Steering Committee WSC Furthermore key topics in the field of mobile personal satcoms have also been focused on through a few invited papers As EMPS has been conceived to gather trends and novelties in the field of mobile personal satcoms it is tightly matched to the natural evolution of the field itself In this frame the reader will notice how the dominant topics are related to system and network issues while a very little number of contributions have been provided in the propagation and channel related areas This represents a natural trend of a field where deep efforts have been paid in the past years to understanding and modelling the physical layer and where the present interest is mostly migrating to the applications Further changes and novelties may be envisaged in the future of this field I believe that EMPS will continue to represent an effective opportunity to catch and understand more deeply this evolution

Interactive Distributed Multimedia Systems and

Telecommunication Services Michel Diaz, Philippe Owezarski, Patrick Senac, 2007-07-23 The 1999 International Workshop on

Interactive Distributed Multimedia Systems and Telecommunication Services IDMS in Toulouse is the sixth in a series that started in 1992. The previous workshops were held in Stuttgart in 1992, Hamburg in 1994, Berlin in 1996, Darmstadt in 1997, and Oslo in 1998. The area of interest of IDMS ranges from basic system technologies such as networking and operating system support to all kinds of teleservices and distributed multimedia applications. Technical solutions for telecommunications and distributed multimedia systems are merging, and quality of service (QoS) will play a key role in both areas. However, the range from basic system technologies to distributed multimedia applications and teleservices is still very broad, and we have to understand the implications of multimedia applications and their requirements for middleware and networks. We are challenged to develop new and more fitting solutions for all distributed multimedia systems and telecommunication services to meet the requirements of the future information society.

Radio Resource Allocation Over Fading Channels Under Statistical Delay Constraints Tho Le-Ngoc, Khoa Tran Phan, 2017-05-10. This SpringerBrief presents radio resource allocation schemes for buffer aided communications systems over fading channels under statistical delay constraints in terms of upper bounded average delay or delay outage probability. This Brief starts by considering a source-destination communications link with data arriving at the source transmission buffer. The first scenario: the joint optimal data admission control and power allocation problem for throughput maximization is considered where the source is assumed to have a maximum power and an average delay constraint. The second scenario: optimal power allocation problems for energy harvesting (EH) communications systems under average delay or delay outage constraints are explored where the EH source harvests random amounts of energy from renewable energy sources and stores the harvested energy in a battery during data transmission. Online resource allocation algorithms are developed when the statistical knowledge of the random channel fading data arrivals (EH) processes governing the system dynamics is unknown a priori. This Brief continues with a source-relay-destination communications link with buffers available at both source and relay as part of a multi-hop network. Optimal resource allocation schemes for this 3-node relaying system to maximize its effective capacity under a delay outage constraint are proposed with special emphasis on relay roles: Half duplex (HD) or full duplex (FD) relay operation. With HD relay, the adaptive link selection relaying problem jointly with both fixed and adaptive power allocation schemes is investigated. Within each transmission frame, either the source-relay link or the relay-destination link is selected to be active depending on the channel conditions. With FD relay under the presence of non-zero residual self-interference (SI), This Brief also presents source and relay power allocation schemes for both cases of available knowledge of the channel state information at transmitter (CSIT): instantaneous or statistical. Professional and researchers working in this related field and advanced level students in electrical or computer engineering will find the content valuable as a reference.

Digital Radio System Design offers a balanced treatment of both digital transceiver modems and RF front end subsystems and circuits. It provides an in-depth examination of the complete transceiver chain which helps to connect the two topics in a unified system concept. Although the book tackles such diverse fields, it treats them in sufficient depth to give the designer a solid foundation and an implementation perspective. Covering the key concepts and factors that characterise and impact radio transmission and reception, the book presents topics such as receiver design, noise, and distortion. Information is provided about more advanced aspects of system design such as implementation losses due to non-idealities. Providing vivid examples, illustrations, and detailed case studies, this book is an ideal introduction to digital radio systems design. Offers a balanced treatment of digital modem and RF front end design concepts for complete transceivers. Presents a diverse range of topics related to digital radio design including advanced transmission and synchronization techniques with emphasis on implementation. Provides guidance on imperfections and non-idealities in radio system design. Includes detailed design case studies incorporating measurement and simulation results to illustrate the theory in practice. **Summaries of Papers Presented at the Optical Data Storage Topical Meeting**, 2006 Channel Coding in Communication Networks Alain Glavieux, 2013-03-01 This book provides a comprehensive overview of the subject of channel coding. It starts with a description of information theory focusing on the quantitative measurement of information and introducing two fundamental theorems on source and channel coding. The basics of channel coding in two chapters: block codes and convolutional codes are then discussed, and for these the authors introduce weighted input and output decoding algorithms and recursive systematic convolutional codes which are used in the rest of the book. Trellis-coded modulations which have their primary applications in high spectral efficiency transmissions are then covered before the discussion moves on to an advanced coding technique called turbo-coding. These codes, invented in the 1990s by C. Berrou and A. Glavieux, show exceptional performance. The differences between convolutional turbo-codes and block turbo-codes are outlined, and for each family the authors present the coding and decoding techniques together with their performances. The book concludes with a chapter on the implementation of turbo-codes in circuits. As such, anyone involved in the areas of channel coding and error-correcting coding will find this book to be of invaluable assistance. **Optical Networks and Components** Partha Pratim Sahu, 2022-07-30 Intended as an undergraduate/postgraduate level textbook for courses on high-speed optical networks as well as computer networks.
