Puttlitz, Paul A. Totta, 2012-12-06 Microelectronic packaging has been recognized as an important enabler for the solid state revolution in electronics which we have witnessed in the last third of the twentieth century Packaging has provided the necessary external wiring and interconnection capability for transistors and integrated circuits while they have gone through their own spectacular revolution from discrete device to gigascale integration At IBM we are proud to have created the initial simple concept of flip chip with solder bump connections at a time when a better way was needed to boost the reliability and improve the manufacturability of semiconductors The basic design which was chosen for SLT Solid Logic Technology in the 1960s was easily extended to integrated circuits in the 70s and VLSI in the 80s and 90s Three I O bumps have grown to 3000 with even more anticipated for the future The package families have evolved from thick film SLT to thin

film metallized ceramic to co fired multi layer ceramic A later family of ceramics with matching expansivity to silicon and copper internal wiring was developed as a predecessor of the chip interconnection revolution in copper multilevel submicron wiring Powerful server packages have been developed in which the combined chip and package copper wiring exceeds a kilometer All of this was achieved with the constant objective of minimizing circuit delays through short efficient

devices The architecture is designed to work as a true false event detector or threshold level alarm of some substances ions etc that are detected through a three electrodes amperometric BioSensor approach The device is envisaged as a Low Power subcutaneous implantable application powered by an inductive link one emitter antenna at the external side of the skin and the receiver antenna under the skin The sensor is controlled with a Potentiostat circuit and then a post processing unit detects the desired levels and activates the transmission via a backscattering method by the inductive link All the instrumentation except the power module is implemented in the so called BioChip Following the idea of the powering link to harvest energy of the magnetic induced link at the implanted device a Multi Harvesting Power Chip MHPC has been also designed
