**Cumulated Index Medicus** ,1999      Bacterial Flora in Digestive Disease C. Scarpignato,Ángel Lanás,2006-01-01

Hundreds of bacterial species make up human gut flora The intestine has at least 400 different species of bacteria totaling over 1012 organisms Of these 99% are anaerobic bacteria The gastrointestinal tract is then exposed to countless numbers of bacterial species and foreign antigens and has embedded a unique and complex network of immunological and non immunological mechanisms to protect the host from potentially harmful pathogens Healthy individuals are generally tolerant to their own microbiota but such tolerance is impaired in patients with both organic and functional gastrointestinal diseases The advancement of the knowledge on microbial gut interactions in health and disease has allowed a more pathophysiologically oriented approach to several challenging clinical conditions There are currently two ways to manipulate enteric flora Antibiotics can selectively decrease tissue invasion and eliminate aggressive bacterial species or globally decrease luminal and mucosal bacterial concentrations depending on their spectrum of activity Alternatively administration of beneficial bacterial species probiotics poorly absorbed dietary oligosaccharides prebiotics or combined probiotics and prebiotics synbiotics can restore a predominance of beneficial commensal flora These two therapeutic approaches are not of course mutually exclusive Rifaximin a poorly absorbed antibiotic targeted at the gastrointestinal tract has been long used in Italy for the treatment of infectious diarrhea in both adults and children During the past few years the appreciation of the pathogenic role of gut bacteria in several organic and functional gastrointestinal diseases has increasingly broadened its clinical use which now covers hepatic encephalopathy small intestine bacterial overgrowth inflammatory bowel disease and colonic diverticular disease Other potential clinical indications are being explored and look promising      **Clinical Nutrition**

detailed estimation of the hecatomb in terms of number of deaths and life expectancy The famine of 1933 was alone responsible for the deaths of 2 6 million Ukrainians and reduced male and female life expectancies to 7 and 11 years respectively Once the crises of the 1930s and 1940s were over the earlier trend in health resumed and mortality declined steadily until the 1960s At this point however a new type of crisis appeared that caused a sustained reversal in the existing trends Life expectancy for women stopped increasing altogether while that for men began a relentless year on year regression Notwithstanding the confusing picture created by the fluctuations of the 1980s and 1990s the long term trend is to further deterioration To understand the factors involved this study analyses in detail the combined effects of different causes of death at different ages *Child Health USA* ,2000 **New Serial Titles** ,1999 A union list of serials commencing publication after Dec 31 1949 Health in the Americas 2002 Pan American Health Organization,2002 The 2002 edition of this quadrennial publication presents a regional analysis of the health situation and trends in the Americas region as well as for each of the 47 countries and territories in the region It is published in two volumes and covers mainly the years from 1997 2000 This edition focuses upon the inequalities in health Volume One looks at issues dealing with leading health and health related indicators ranging from mortality and changes in life expectancy to the relationship between health and income distribution It also considers current health conditions and trends including disease prevention and control health promotion and environmental protection Volume Two examines each country s overall health conditions including institutional organisation health regulations and the overall operation of health services Gastrointestinal Disease Anthony J.
