1999 Portrait World Atlas:

A Global Atlas of Atolls Walter M. Goldberg, Eugene C. Rankey, 2023-08-29 Scattered like dots rising from the deep across vast expanses of the world's tropical and subtropical oceans atolls with their turquoise lagoons and reefs teeming with colorful marine life have captured the public imagination. They have also been the homeland of millions of people for millennia as various groups of migrants spread across the far reaches of the Pacific Indian and Western Atlantic regions. Developed from recently available satellite data, *A Global Atlas of Atolls* presents high quality details of 476 atolls across the globe characterizing aspects of the atoll rim, the lagoon, and their coral reef communities in unprecedented detail. In synthesizing and enhancing understanding of these unique seascapes, this volume provides a distinct compendium of descriptions and images as well as documentation of the environmental conditions of winds, waves, and tides, and a summary of the background literature for each atoll area. There is no comparable work. After an introduction that includes a glossary of terms, each atoll is documented in the form of an atlas written for scientists but accessible to any diver or reader interested in these spectacular reef island habitats. This book also describes some current challenges and perspectives on their future. It will be useful as a reference work for marine scientists while providing a minimum of technical jargon for those who are not scientists but who enjoy reading about exotic places with unusual attributes. Chapter 3 of this book is freely available as a downloadable Open Access PDF at <http://www.taylorfrancis.com> under a Creative Commons Attribution Non-Commercial No Derivatives CC BY-NC-ND 4.0 license.

Portraits of the Earth Timothy G. Feeman, 2002 Every map is a tool, a product of human effort and creativity that represents some aspects of our world or universe. This course was powered by the belief that by exploring the mathematical ideas involved in creating and analyzing maps, students would see how mathematics could help them to understand and explain their world. From the Preface, *Portraits of the Earth* exemplifies the AMS's mission to bring the power and vitality of mathematical thought to the nonexpert. It is designed to teach students to think logically and to analyze the technical information that they so readily encounter every day. Maps are exciting visual tools that we encounter on a daily basis, from street maps to maps of the world accompanying news stories to geologic maps depicting the underground structure of the earth. This book explores the mathematical ideas involved in creating and analyzing maps, a topic that is rarely discussed in undergraduate courses. It is the first modern book to present the famous problem of mapping the earth in a style that is highly readable and mathematically accessible to most students. Feeman's writing is inviting to the novice yet also interesting to readers with more mathematical experience. Through the visual context of maps and mapmaking, students will see how contemporary mathematics can help them to understand and explain the world. Topics explored are the shape and size of the earth, basic spherical geometry, and why one can't make a perfect flat map of the planet. The author discusses different attributes that maps can have and determines mathematically how to design maps that have the desired features. The distortions that arise in making world maps are quantitatively analyzed. There is an in-depth discussion on the

design of numerous map projections both historical and contemporary as well as conformal and equal area maps Feeman looks at how basic map designs can be modified to produce maps with any center and he indicates how to generalize methods to produce maps of arbitrary surfaces of revolution Also included are end of chapter exercises and laboratory projects Particularly interesting is a chapter that explains how to use MapleR add on software to make maps from geographic data points This book would make an excellent text for a basic undergraduate mathematics or geography course and would be especially appealing to the teacher who is interested in exciting visual applications in the classroom It would also serve nicely as supplementary reading for a course in calculus linear algebra or differential geometry Prerequisites include a solid grasp of trigonometry and basic calculus RWaterloo Maple Inc Ontario Canada
