Arthroscopy Of The Knee Joint:

Arthroscopy of the Knee Joint Hans-Rudolf Henche, Jörg Holder, 2012-12-06 Rapid developments in this successful diagnostic and operative technique have called for a new edition of *Arthroscopy of the Knee Joint* This second edition has been completely revised and retains very little material from the first edition The diagnostic section has been considerably expanded and elucidated and the operative section adapted to modern technology The first part of the book presents the external conditions and pre requisites for diagnostic arthroscopy The endoscopic anatomy and pathology of the knee joint are covered in detail Particular emphasis is placed on practical hints for accurate arthroscopic procedures The second part then discusses operative techniques The reader discovers step by step how and which pathological findings should in the author's opinion be treated Here too the problems and possible complications of arthroscopic surgery relevant to the individual techniques are dealt with in detail Equipped with this book the reader will be thoroughly informed on all current arthroscopic methods and possibilities

Arthroscopy of the Knee Joint H.-R. Henche, 2013-06-29 In 1921 the Swiss surgeon BIRCHER published the first report on arthroscopy of the knee joint The initial trials with the method revealed problems mainly technical in origin which caused it to be abandoned and forgotten until recently Modern technical improvements for which Japanese orthopaedic surgeons above all WATANABE were mainly responsible have now led to a revival of interest in this method of investigation The quality and versatility of the instruments currently available and the experience of the endoscopists who use them are such that arthroscopy of the knee joint is becoming an indispensable diagnostic aid Arthroscopy is superior to arthrotomy in every respect it is not only simpler but can be carried out on an ambulatory basis under local anaesthesia In addition it provides more information than arthrotomy and the arthroscopic findings can be simply documented photographically The complication rate is extremely low cumulated statistics recently obtained from six clinics revealed no case of infection following nearly 4 000 arthroscopies The main indication for arthroscopy is the painful diagnostically obscure knee joint in the widest sense The procedure is also useful for further investigation of knee joint lesions which have already been diagnosed as it allows their type and extent to be diagnosed more precisely and the indication for surgery in a given case can be assessed more clearly Unnecessary surgery can often be avoided in this manner Arthroscopic biopsy is simple and a variety of operations e g
