**Claudio Guarnaccia, Lamberto
Tronchin, Massimo Viscardi**

Alternatives For Landmine Detection:

Alternatives for Landmine Detection ,2003 Antipersonnel mines remain a significant international threat to civilians despite recent intense efforts by the United States other developed countries and humanitarian aid organizations to clear them from postconflict regions Mines claim an estimated 15 000 20 000 victims per year in some 90 countries They jeopardize the resumption of normal activities from subsistence farming to commercial enterprise long after periods of conflict have ceased For example in Afghanistan during 2000 mines claimed 150 300 victims per month half of them children Although most of these mines were emplaced during the Soviet occupation of Afghanistan from 1979 to 1988 they continue to pose a serious risk to returning refugees and have placed vast tracts of farmland off limits The United States currently invests about 100 million annually in humanitarian mine clearance the largest commitment of any country Despite this investment and the funding from many other developed nations and nongovernmental organizations at the current rate clearing all existing mines could take 450 500 years

Alternatives for Landmine Detection Jacqueline MacDonald Gibson, Jacqueline MacDonald, J. R. Lockwood, John E. McFee, Thomas Altshuler, Thomas Broach, 2003 At the rate that government and nongovernmental organizations are clearing existing landmines it will take 450 500 years to rid the world of them Concerned about the slow pace of demining the Office of Science and Technology asked RAND to assess potential innovative technologies being explored and to project what funding would be required to foster the development of the more promising ones The authors of this report suggest that the federal government undertake a research and development effort to develop a multisensor mine detection system over the next five to eight years

Detection of Explosives and Landmines Hiltmar Schubert, Andrey Kuznetsov, 2012-12-06 This ARW is the third NATO sponsored workshop on Explosives Detection and Humanitarian Demining The previous events were Detection and Destruction of Anti Personnel Landmines Moscow 1997 Explosives Detection and Decontamination of the Environment Prague 1997 Over the last decade applied research in Humanitarian Demining has made progress to some extent but according to the tremendous tasks of Demining and the lack of scientific methods for practical detection of explosive devices research activities are still of the same importance than ever before Concerning countermeasures against terrorism the detection of explosives is one of the key factors but the practical applications are not sufficient solved An international exchange of research results are therefore urgent to find out the most promising measures for application The coincidence of this ARW and the terrible disaster of New York and Washington may demonstrate the importance of this task In consequence the explosive device detection technologies can make a major contribution to collective family and individual security In developed countries these technologies provide a strong deterrent and preventative measure against terrorist threats In less developed regions they can improve individual institutional and state security lessening the insecurity that motivates many terrorists acts The elimination of landmine threats is just one of many ways of achieving this However our attempts to meet the extremely difficult technical challenges posed by landmine

and UXO contamination are inevitably leading us to new technological approaches

Anti-personnel Landmine

Detection for Humanitarian Demining Katsuhisa Furuta, Jun Ishikawa, 2009-01-24 Anti personnel Landmine Detection for Humanitarian Demining reports on state of the art technologies developed during a Japanese National Research Project 2002 2007 The conventional method of landmine detection is using metal detectors to sense the metal in mines but often other metal fragments in minefields camouflage landmines and hinder progress using this form of demining The challenge is to develop detection systems that can discriminate between AP landmines and random metal fragments The JST adopted research proposals and the results are reported here This book concentrates on aspects of three approaches to AP mine detection enhancing and confirming the results of metal detection scans using GPR using robot vehicles and manipulators to operate within minefields remotely and methods of sensing the explosives within mines Results are presented in the fields of GPR nuclear quadrupole resonance neutron thermal analysis and biosensors The integration of these methods for workable robot operation is demonstrated The project was carried out in conjunction with mine action centers in Croatia Cambodia and Afghanistan Evaluation data from field trials are also given

Modelling, Simulation and Data Analysis in

Acoustical Problems Claudio Guarnaccia, Lamberto Tronchin, Massimo Viscardi, 2020-06-23 Modelling and simulation in acoustics is currently gaining importance In fact with the development and improvement of innovative computational techniques and with the growing need for predictive models an impressive boost has been observed in several research and application areas such as noise control indoor acoustics and industrial applications This led us to the proposal of a special issue about Modelling Simulation and Data Analysis in Acoustical Problems as we believe in the importance of these topics in modern acoustics studies In total 81 papers were submitted and 33 of them were published with an acceptance rate of 37.5% According to the number of papers submitted it can be affirmed that this is a trending topic in the scientific and academic community and this special issue will try to provide a future reference for the research that will be developed in coming years
