Cancer Metastases Research Akira Watanabe, 2008 Metastasis is the spread of a disease from one organ or part to another non contiguous organ or part Only malignant tumour cells and infections have the capacity to metastasise Cancer cells can break away from a primary tumour penetrate into lymphatic and blood vessels circulate through the bloodstream and grow in a distant focus metastasise in normal tissues elsewhere in the body Metastasis is considered a hallmark of malignancy All tumours can metastasise albeit to varying degrees barring a few exceptions eg Glioma and Basal cell carcinoma never metastasize When cancer cells spread to form a new tumour it is called a secondary or metastatic tumour and its cells are like those in the original tumour This means for example that if breast cancer spreads metastasizes to the lung the secondary tumour is made up of abnormal breast cells not abnormal lung cells The disease in the lung is then called metastatic breast cancer not lung cancer Only malignant tumour cells and infections have the capacity to metastasize This book presents the latest research in the field from around the world

Osteoporosis in Clinical Practice Piet Geusens, Philip N. Sambrook, Robert Lindsay, 2012-12-06 When I was a young intern in internal medicine osteoporosis was defined mainly as a fracture occurring in elderly people However although plain X ray examination was recognized as an insensitive way to detect osteoporosis hypodense bone was already considered as the reflection of the disease Over the past 20 years considerable progress has been accomplished In terms of prevalence incidence risk factors and the burden of osteoporosis and low energy fracture we can appreciate the magnitude of the problem and its impact on quality of life We are well aware that vertebral fracture which can be acutely associated with a low clinical expression leads to significant long term impairments The costs for the individual and for the health budget Le society are estimated better We now have a clear definition of the disease such as low bone mass and architectural defects resulting in increased fragility For the former part of the definition the clinician can use accurate and precise tools allowing

them to distinguish how their patient's bone mineral content differs from that of a young healthy population in which fracture occurs very rarely. For the second series of fragility determinants, i.e. structure methods are in rapid progress and will provide information to clinicians on these variables in the near future. Basic and clinical research have allowed major improvements in the understanding of the pathophysiology of the disease. New genes implicated in low and/or high bone mass have been characterized.

Trends in Breast Cancer Research Andrew P. Yao, 2005 Breast cancer is a malignant tumour that has developed from cells of the breast. A malignant tumour is a group of cancer cells that may invade surrounding tissues or spread, metastasize to distant areas of the body. The disease occurs almost entirely in women but men can get it as well. The main types of breast cancer are ductal carcinoma in situ, invasive ductal carcinoma, lobular carcinoma in situ, invasive lobular carcinoma, medullary carcinoma and Paget's disease of the nipple. About 1 of 8 women will get it in her lifetime. This new book presents state of the art research in this fast moving field.

Manual of Clinical Oncology Casciato, Mary C. Territo, 2012 Manual of Clinical Oncology is a concise pocket manual that incorporates basic science, clinical findings and available technology into the diagnosis and management of cancer. It focuses on information useful for participating in rounds and for making diagnostic and therapeutic decisions at the bedside of cancer patients. The seventh edition is a practical, accessible, comprehensive guide to the management of patients with cancer.

Treatment of Multiple Myeloma and Related Disorders S. Vincent Rajkumar, Robert A. Kyle, 2008-10-27 Due to major advances in understanding the biology and pathogenesis of the disease, the management of multiple myeloma is changing rapidly. New diagnostic and prognostic criteria have been introduced and treatment options are multiplying with high dose chemotherapy regimens, stem cell transplants and the development of novel agents and immune based strategies that target tumor cells directly. This book is aimed at the practitioner who is looking to put these advances into clinical context. It will serve as an up to date resource for treatment of myeloma and related disorders. Chapters are written by international authorities and contain color photos, diagrams and algorithms outlining preferred treatment strategies. Relevant scientific information is integrated throughout but the focus here is on providing practical therapeutic guidance for oncologists and hematologists caring for myeloma patients. The book covers all myeloma subtypes and related disorders including amyloidosis, Waldenström macroglobulinemia, plasmacytoma, MGUS and POEMS syndrome.
