The topics reviewed range from using BAC libraries as resources for marsupial and monotreme gene mapping and comparative genomic studies to using BACs as vehicles for maintaining the large infectious DNA genomes of viruses. The large size of the insert DNA in BACs and the ease of engineering mutations in that DNA within the bacterial host allowed manipulating the BAC viral DNA of Varicella Zoster Virus. Other reviews include the maintenance and suitable expression of foreign genes from a Baculovirus genome including protein complexes from the BAC viral DNA and generating vaccines from BAC viral DNA genomes of Marek's disease virus. Production of multi purpose BAC clones in the novel *Bacillus subtilis* host is described along with chapters that illustrate the use of BAC transgenic animals to address important issues of gene regulation in vertebrates such as functionally identifying novel cis acting distal gene regulatory sequences.

*The Screening of a Horse Bacterial Artificial Chromosome (BAC) Library with Type I Markers and the Isolation and Characterization of Microsatellites* Elaine Lynnette Philbrick, 2002

*Development of an Akata-based Bacterial Artificial Chromosome* Lavon Paongo Tonga, 2006 Genetic mutagenesis of individual genes in context of the complete Epstein Barr virus genome is essential to understanding function of proteins. Past strategies for deriving a mutant within EBV have been to disrupt a gene with a cassette encoding for antibiotic resistance flanked with sequence surrounding the targeted gene. The cassette is transfected into virus carrying cells and positive selection is applied to select for a genome in which homologous recombination with flanking sequence has occurred. Although this method has met with success it has limitations. It is time consuming since a successful insertion of the cassette relies on a rare recombination event in the eukaryotic cell and it allows only a narrow range of mutations to be made. Several herpesviruses have been cloned as bacterial artificial chromosomes (BAC) where a mini F plasmid is cloned into the viral genome so that it can be propagated in both eukaryotic and prokaryotic cells. Standard bacterial genetics can then be applied to the whole viral genome in prokaryotic cells prior to transferring it into eukaryotic cells for production of mutant progeny.
