Wecker, 2012-12-06 Phenomena as diverse as tuberculin sensitivity delayed sensitivity to soluble proteins other than tuberculin contact allergy homograft rejection experimental autoallergies and the response to many microorganisms have been classified as members of the class of immune reactions known as delayed or cellular hypersensitivity Similarities in time course histology and absence of detectable circulating immunoglobulins characterize these cell mediated immune reactions in vivo The state of delayed or cellular hypersensitivity can be transferred from one animal to another by means of sensitized living lymphoid cells CHASE 1945 LANDSTEINER and CHASE 1942 MITCHISON 1954 The responsible cell has been described by GOWANS 1965 as a small lymphocyte Passive transfer has also been achieved in the human with extracts of sensitized cells LAWRENCE 1959 The in vivo characteristic of delayed hypersensitivity from which the class derives its name is the delayed skin reaction When an antigen is injected intradermally into a previously immunized animal the typical delayed reaction begins to appear after 4 hours reaches a peak at 24 hours and fades after 48 hours It is grossly characterized by induration erythema and occasionally necrosis The histology of the delayed reaction has been studied by numerous investigators COHEN et al 1967 GELL and HINDE 1951 KOSUNEN 1966 KOSUNEN et al 1963 MCCLUSKEY et al 1963 WAKSMAN 1960 WAKSMAN 1962 Initially dilatation of the capillaries with exudation of fluid and cells occurs **Experimental Models of Chronic Inflammatory Diseases** L.E. Glynn, H.D. Schlumberger, 2012-12-06 With the introduction of antibiotics acute inflammatory disease has ceased to be the dominant problem in general medical practice and its place is now increasingly occupied by chronic inflammatory disease of which the rheumatic diseases constitute the most important group Two aspects of these diseases need to be considered their aetiology and their pathogenesis In some respects the latter is more important since even when the aetiology is known as for example the haemolytic streptococcus in rheumatic fever the mechanism by which the infecting agent accomplishes the development of the lesions that characterise the disease are still largely unknown Still more so is this the case in rheumatoid arthritis and other chronic inflammations where the aetiological agents are unknown In an attempt to clarify the pathogenic mechanisms involved several attempts have been made to induce comparable lesions in experimental animals partly to test underlying hypotheses and partly to provide test situations for the trial of new therapeutic agents In view of the deficiencies in the current drug treatment of chronic inflammatory disease there are many who feel that this is largely due to the inadequacy of the models available for test purposes *The Antibiotic Era* Scott H. Podolsky, 2015-01-15 During the post World War II wonder drug revolution antibiotics were viewed as a panacea for mastering infectious disease This book
