### **Air-surface Exchange Of Mercury In The Environment:**

*Mercury in the Environment* Michael S. Bank, 2012-05-31 Mercury deposition and contamination is widespread and well documented and it continues to be a public health concern for certain sectors of the global human population in both developed and developing countries This edited volume focuses on integrating the diverse sciences involved in the process of mercury cycling in the environment from the atmosphere through terrestrial and aquatic food webs and human populations to develop a comprehensive perspective on this important environmental pollutant Using a systems level approach this book provides recommendations on mercury remediation risk communication education and monitoring In response to a growing need for understanding the cycling of this ubiquitous pollutant the science of mercury has grown rapidly expanding into several interdisciplinary fields and encompassing such disparate academic and scientific disciplines as biogeochemistry economics sociology public health decision sciences physics global change and mathematics Only recently have scientists really begun to establish more holistic approaches to studying mercury pollution giving rise to investigations that have furthered the integration of a multi tiered approach especially by using chemistry biology and human health sciences collectively The study of mercury pollution has produced a variety of contributions to domestic and international policies related to the management of mercury in the environment Provided by publisher *Environmental Chemistry and Toxicology of Mercury* Guangliang Liu, Yong Cai, Nelson O'Driscoll, 2011-11-07 This book provides the fundamentals recent developments and future research needs for critical mercury transformation and transport processes as well as the experimental methods that have been employed in recent studies The coverage discusses the environmental behavior and toxicological effects of mercury on organisms including humans and provides case studies at the end of each chapter Bringing together information normally spread across several books this text is unique in covering the entire mercury cycle and providing a baseline for what is known and what uncertainties remain in respect to mercury cycling *Air-surface Exchange of Mercury in the Environment* Zifan Xiao, 1995 **Mercury Contaminated Sites** Ralf Ebinghaus, Ralph R. Turner, Luiz D. de Lacerda, O. Vasiliev, Wim Salomons, 2013-11-11 Mercury is outstanding among the global environmental pollutants of continuing concern Especially in the last decade of the 20 century environmental scientists legislators politicians and the public have become more aware of mercury pollution in the global environment It has often been suggested that anthropogenic emissions are leading to a general increase in mercury on local regional and global scales Numerous industrial activities including the mining of gold silver and mercury itself have caused mercury contamination of terrestrial and aquatic ecosystems Mercury contaminated sites are abundant worldwide Mercury has been accumulated as an industrial legacy in the rocks soils and sediments at and adjacent to industrial sites and now may pose significant risks to human and ecological health Direct inputs of mercury into the environment by industrial activities have generally decreased significantly in the Western world over the past three decades However sources such as coal combustion and the use of

mercury in gold and silver mining continue to be of importance on a global scale The same is true for diffuse sources such as terrestrial landscapes that have been impacted by mercury inputs from the atmosphere in the past Soils and vegetation located close to large atmospheric mercury sources have clearly been sinks while these sources were active in the past In the long run however these soils may have become important diffuse area sources after the original emissions were discontinued

**Mercury Fate and Transport in the Global Atmosphere** Nicola Pirrone, Robert Mason, 2009-06-15 Mercury primarily because of its existence and bioaccumulation as methylmercury in aquatic organisms is a concern for the health of higher trophic level organisms or to their consumers This is the major factor driving current research in mercury globally and in environmental regulation and is the driver for the current UNEP Global Partnership for Mercury Transport and Fate Research UNEP F and to develop and implement such policies and strategies To achieve this a series of coordinated scientific endeavors focused on the estimation of sources measurement and validation of concentrations and processes and modeling coupled with interpretation of the results within a policy framework is likely to be required

Anthony Carpi, 1997 *Mercury Contaminated Sites* Berdj Kenadjian, 2005-11 From Darkness to Light is the true story of how two little known men guided by unseen celestial forces confronted and overcame overwhelming obstacles to create a new understanding of the root causes of world disorder and its bitter fruit of widespread anxiety *Atmospheric and catchment mercury concentrations and fluxes in Fennoscandia*, 2010 Abstract Measurements in Southern Fennoscandia show a weak declining trend in mercury deposition which can be attributed to reduction controls in EU countries Deposition of mercury in Arctic areas is likely to be governed by the amount of mercury in background air and therefore largely dependent on mercury emissions from mercury sources in the entire northern hemisphere Hence further reduction in anthropogenic emissions of mercury will require control measures in the entire northern hemisphere The so called atmospheric mercury depletion events AMDEs are occurring during polar spring How much of the deposited mercury that remains contra is re emitted to the atmosphere is however crucial for assessing the importance of AMDE in the Arctic environment Forest soils are an important sink for mercury deposited from the atmosphere However this sink can be affected by perturbations in conjunction to common forestry practices and lead to mobilization of the stored mercury and enhanced methyl mercury formation Similar effects can be expected in areas where climate change results in large increases in precipitation amounts The processes governing these changes in mercury mobilization are to some extent unknown and general predictions of the magnitude of the changes are thus associated with a large degree of uncertainty

**Organometallic Compounds in the Environment** P. J. Craig, 2003-09-12 A knowledge of the chemical structure and concentration of organometal compounds throughout the ecosystem is important in working out the pathways and

mechanisms by which metals distribute themselves throughout the environment Treating the topic as an integrated subject area the Second Edition of Organometallic Compounds in the Environment covers all the recent developments in analytical techniques and reports all the new work that has been achieved since the first book Covers the general importance and characteristics of organometallic species Includes general developments in analytical techniques Discusses several minority elements including antimony and selenium The book addresses the subject in a single manageable size and each chapter can be used either as a single review or sequentially within the topic area A useful resource for all researchers and scientists in industry working with organometallic compounds including chemists environmentalists and ecologists
