

## AC VOLTAMMETRY

In the alternating current polarography (ACP) introduced by Breyer in 1952 a linear or staircase-shaped direct potential ( $E=$ ) is modulated by a sinusoidal voltage ( $E\sim$ ) with a small amplitude ( $\Delta E_A = 5\text{--}20\text{ mV}$ ). This produces an alternating current  $i\sim$ , whose size is determined by the direct potential  $E=$  currently applied and which is greatest at the half-wave potential. By plotting the measured alternating current against the direct potential a peak-shaped alternating current polarogram is obtained.
