Systems Practice: How to Act in a Climate Change World Ray Ison,2010-07-20 It is now accepted that humans are changing the climate of the Earth and this is the most compelling amongst a long litany of reasons as to why collectively we have to change our ways of thinking and acting Most people now recognise that we have to be capable of adapting quickly as new and uncertain circumstances emerge this capability will need to exist at personal group community regional national and international levels all at the same time Systems Practice is structured into four parts Part I introduces the societal need to move towards a more systemic and adaptive governance against the backdrop of human induced climate change Part II unpacks what is involved in systems practice by means of a juggler metaphor examining situations where systems thinking offers useful understanding and opportunities for change Part III identifies the main factors that constrain the uptake of systems practice and makes the case for innovation in practice by means of systemic inquiry systemic action research and systemic intervention The book concludes with Part IV which critically examines how systems practice is or might be utilised at different levels from the personal to the societal The development of our capabilities to think and act systemically is an urgent priority and Systems Practice aims to show how to do systems thinking and translate that thinking into praxis theory informed practical action which will be welcomed by those managing in situations of complexity and uncertainty across all domains of professional and personal concern *Research Grants Index* National Institutes of Health (U.S.). Neuromechanics and Control of Physical Behavior: from Experimental and Computational Formulations to Bio-inspired Technologies Massimo Sartori, Francisco J. Valero-Cuevas, Alfred C. Schouten, Matthew Tresch, Yoshihiko Nakamura, Manish Sreenivasa, 2019-08-15 The term neuromechanics defines an integrative approach that combines the neuromuscular control and the biomechanical aspects of physical behavior in humans and animals Crucial to this approach is a detailed description and modeling of the interaction between the nervous system and the controlled biomechanical plant Only then do we have the broader context within which to understand evolution movement mechanics neural control energetics disability and rehabilitation In addition to enabling new basic science directions understanding the interrelations between movement neural and mechanical function should also be leveraged for the development of personalized wearable technologies to augment or restore the motor capabilities of healthy or impaired individuals Similarly this understanding will empower us to revisit current approaches to the design and control of robotic and humanoid systems to produce truly versatile human like physical behavior and adaptation in real world environments This Research Topic is therefore poised at an opportune moment to promote understanding of apparently disparate topics into a coherent focus
