Project Management for Research and Development Lory Mitchell Wingate, 2025-04-03 Research and development R D activities do not fit the traditional project model They may seem difficult to manage because of their inherent ambiguity the need for creative exploration and often the lack of having defined

milestones and outcomes However project management methods along with systems engineering as a complementary discipline provide the ability to categorize R D activities bound them and then assess progress along a defined course of action They also provide information about status and progress visibility into opportunities and challenges that might otherwise be missed allowing timely course corrections Project Management for Research and Development Guiding Innovation for Positive R D Outcomes Second Edition provides methods for optimizing results in R D by using structured processes that come from project management and are intertwined with the key complementary discipline of systems engineering It provides processes tools and techniques to assess and manage creative activities in an optimal way The core of the book is a flexible framework which lifts the burden off organizations that do not want to invest heavily in implementing a significant number of often conflicting processes It is a lightweight flexible structure to help organizations and individuals meet their most important goals no matter how complicated or complex these goals may be Each chapter in the book includes Apply Now exercises which allow immediate application of fundamental concepts summarizes key points of concepts and terms and provides templates to apply the ideas from each chapter to a real life situation The book also features unique and creative case studies to demonstrate the application of project management to various R D projects **Computer**

Thymic Stromal Alterations and Genetic Disorders of Immune System Claudio Pignata, Ana E. Sousa, 2015-12-07

The pathogenic mechanisms underlying primary T cell disorders are mainly related to molecular alterations of genes whose expression is intrinsic to hematopoietic cells. However, since the differentiation process requires a crosstalk among thymocytes and the thymic microenvironment, molecular alterations of genes involved in the differentiation and functionality of the stromal component of the thymus may lead to a severe T cell defect or failure of central tolerance as well. The first example of severe combined immunodeficiency SCID not related to an intrinsic alteration of the hematopoietic cell but rather of the thymic epithelial component is the Nude SCID phenotype inherited as an autosomal recessive disorder whose hallmarks are the T cell defect and the absence of the thymus. The clinical and immunological phenotype is the human equivalent of the murine Nude SCID syndrome which represents the first spontaneous SCID identified in nude mice in 1966. For over 3 decades, studies of immune system in these mice enormously contributed to the overall knowledge of cell-mediated immunity in the assumption that the athymia of these mice was solely responsible for the T cell immunological defect. This syndrome is due to mutations of the transcription factor FOXP1 belonging to the forkhead box gene family which is mainly expressed in the thymus and skin epithelial cells where it plays a critical role in differentiation and survival. An alteration of the thymic structure is also a feature of the DiGeorge syndrome DGS which has been long considered the human counterpart of the nude mice phenotype. This syndrome is frequently associated to a deletion of the 22q11 region which contains approximately 30 genes including the TBX1 gene which is responsible for most of the clinical features of DGS in humans and mice. In this syndrome, common manifestations are cardiac malformations, speech delay, hypoparathyroidism, and immunodeficiency, even though the immunological hallmarks of the T cell defect in DiGeorge syndrome are profoundly different from those reported in human Nude SCID. The divergence of the phenotype among these 2 entities raised the possibility that the FOXP1 transcription factor represents the real key stromal molecule implicated in directing the hematopoietic stem cell toward a proper T cell fate. Thymic stromal component of the primary lymphoid organ is also required to negatively select the autoreactive clones, a process driven by the expression of tissue-specific antigens (TSA) by medullary thymic epithelial cells (mTECs). The expression of genes encoding TSA antigens is mediated by the autoimmune regulator AIRE gene encoding a transcription factor expressed in mTECs. Molecular alterations of this gene are associated to autoimmune polyendocrinopathy, candidiasis, ectodermal dystrophy (APECED), a rare autosomal disorder which may be considered the prototype of an autoimmune disease due to the failure of central tolerance homeostasis. All these experiments of nature led to unravel novel pathogenic mechanisms underlying inherited disorders of

immune system and of note to clarify the pivotal role of epithelial cells in the maturation and education process of T cell precursors

The Aging Immune System and Health Valquiria Bueno, Rafael Solana, Annemieke Boots, 2020-01-15 The world population presents an increased percentage of individuals over 65 years old and the fastest growing subgroup is over 85 years old The increase in life expectancy observed in the last century has not been synonymous with extra years lived in good health disability free years Population studies have shown that as individuals age they can present a great heterogeneity of ability and health Therefore aging has been associated for some individuals with disabilities and hospitalizations Deaths related to infectious pathogens are increased in the aging population mainly due to pneumonia and influenza whereas Cytomegalovirus Epstein Barr virus among other viruses seem to contribute to the low grade inflammatory process observed in inflammaging Aging is a complex and multifactorial process in which functions of the organism are adjusted remodelled in order to deal with damaging events during life One of the most important changes in aging individuals occurs in the immune system innate and adaptive responses with consequences such as poor response to new infections and vaccinations increased susceptibility to cancer development and autoimmune diseases frailty and organ dysfunction In addition it has been proposed that immunosenescence not only reflects the aging of the organism but also contributes to this process Bone marrow presents decreased hematopoiesis the thymus undergoes involution and lymphoid organs lymph nodes spleen also present reduced functionality Therefore cells derived matured or residing in these tissues decline in number and function These changes have been identified in experimental models in vitro conditions peripheral blood and biopsies via biomarkers such as cell phenotype stimulus induced proliferation cytokines and antibodies levels Telomere length and telomerase activity also decline in bone marrow derived and peripheral blood cells and have been shown to play a role in immunosenescence More recently the investigation of short non coding RNA molecules microRNAs miRNAs pointed to this system as a possible control of aging related mechanisms Data obtained on these markers for aging individuals could lead to the generation of a marker panel for pathology prediction to indicate interventions and to evaluate the efficacy of interventions Interventions such as nutrition supplements exercise vaccination different dose concentration of antigen adjuvants have been proposed to circumvent age related diseases Considering the heterogeneity in the aging process further investigation is vital before the indication of interventions for aging individuals As the extension of life expectancy is a reality it is a challenge to understand how the aging population copes with the remodelling of the organism and how interventions could provide longevity in good health
