antibiotic resistance and the ongoing emergence of antibiotic resistant bacteria is a public health issue of increasing concern. The concern is that current life saving antibiotics are becoming less effective. The requirement is for more toxic and costly antibiotics reducing the available alternatives. Antibiotic use is significant in the emerging public health crisis of antibiotic resistance. Although most antibiotic use occurs in agricultural settings relatively little attention has been paid to how antibiotic use in farm animals contributes to the overall problem of antibiotic resistance. The global spread of antimicrobial resistant pathogenic bacteria is a continuing challenge to the healthcare of humans and domesticated animals. This book discusses antimicrobial resistance mechanisms relevant to food producing animals. Students, researchers, scientists, environmentalists, veterinary practitioners, academicians, stakeholders and policymakers can benefit from using *Antimicrobials in Animal Husbandry* as a resource that addresses microbial biotechnology, microbiology, toxicology and all disciplines related to antimicrobial research. Features of the book: Covers antimicrobial resistance in animal husbandry with up to date research. Describes the public health impact of the use of antibiotics in animal husbandry. Includes recent references on each plausible antimicrobial resistance in human and animal health. Describes the impact of improper use of antimicrobials on animal production. Develops strategies for alternatives to antimicrobial application in food animals. Aims to minimize the health related problems of consumers resulting from antimicrobial residues in food producing animals.

Antibiotic Alternatives and Combinational Therapies for Bacterial Infections Sanna Sillankorva, Maria Olívia Pereira, Mariana Henriques, 2019-03-20. The thoughtless person playing with penicillin treatment is morally responsible for the death of the man who succumbs to infection with the penicillin resistant organism. As Alexander Fleming predicted already in 1945 bacteria have become resistant to antibiotics. From time to time we are bombarded with news of infections and deaths caused by antibiotic resistant and multiple drug resistant superbugs. This increase of resistance towards commonly used antibiotics due to decades of use, misuse and abuse of antibiotics is today a global health concern. Research investments on development of new antimicrobials that can fight antimicrobial resistant microorganisms are scarce yet some new antibiotic discoveries have been described recently. Nevertheless the advent of antibiotic failure due to bacterial resistance has brought interest in other alternative therapies. Natural products from microbial origin are examples of such alternative therapies. Bacteriophages are bacterial viruses and consequently bacterial natural enemies and together with their derived enzymes are efficient towards antibiotic resistant bacteria. Antimicrobial peptides (AMP) natural compounds with alternative mechanisms of action are short length peptides present in a variety of sources and in many forms. AMP have been recognized as promising candidates for replacing classical antimicrobials due to their multiple mechanisms of action and general low specificity in terms of molecular targets which reduces the chance of acquired resistance. Quorum sensing inhibitors (QSI) are destabilisers of key communication mechanisms that regulate virulence and the establishment of biofilm related infections.
