Caregiving for Alzheimer's Disease and Related Disorders Steven H. Zarit, Ronda C. Talley, 2012-12-02 Assisting someone with Alzheimer's disease or

another illness that causes dementia is incredibly demanding and stressful for the family. Like many disabling conditions, Alzheimer's disease leads to difficulty or inability to carry out common activities of daily life and so family members take over a variety of tasks ranging from managing the person's finances to helping with intimate activities such as bathing and dressing. Key coverage in *Caregiving for Alzheimer's Disease and Related Disorders* includes Early diagnosis and family dynamics, Emotional needs of caregivers, Developmentally appropriate long term care for people with Alzheimer's, Family caregivers as members of the Alzheimer's treatment Team, Legal and ethical issues for caregivers, Faith and spirituality, The economics of caring for individuals with Alzheimer's disease, Cultural, racial, ethnic and socioeconomic issues of minority caregivers, Advances in Alzheimer's disease research. *Caregiving for Alzheimer's Disease and Related Disorders* offers a wealth of insights and ideas for researchers, practitioners and graduate students across the caregiving fields including psychology, social work, public health, geriatrics and gerontology and medicine as well as public and education policy makers.

Alzheimer's Disease Abraham Fisher, Israel Hanin, Chaim Lachman, 2012-12-06 Alzheimer's disease is a primary neurodegenerative disease whose incidence and prevalence is rapidly approaching epidemic proportions. A major reason for this is that man is living longer than he has ever lived before and the likelihood of contracting the disease is significantly greater within the elderly portion of the population. The problem becomes even more acute in the light of recent estimates which predict that the number of people living beyond the age of 65 is expected to continue to increase. The impact of these statistics on the family and the health care industry in terms of time effort and cost are staggering. A recent report issued by the Michigan Task Force on Alzheimer's Disease and Related Conditions 1987 effectively underscores this last point. Each person with a dementing disease requires an average of seven years of care either at home or in a residential care facility. Care provided at home is estimated to cost about 12 000 annually for a total of 84 000 per person. This is a conservative figure however because many persons with dementia spend their last few years in a nursing home at an average cost of 22 000 per year and some spend from 10 to 15 years in a nursing home for a total cost of 220 000 to 330 000. *Advances in Research and Treatment for Alzheimer's Disease* Samuel Barrack, 2012-01-30 Alzheimer's disease AD is the most common form of dementia. There is no cure for the disease which worsens as it progresses and eventually leads to death. The cause and progression of Alzheimer's disease are not well understood. Research indicates that the disease is associated with plaques and tangles in the brain. Current treatments only help with the symptoms of the disease. There are no available treatments that stop or reverse the progression of the disease. As of 2012 more than 1000 clinical trials have been or are being conducted to find ways to treat the disease but it is unknown if any of the tested treatments will work. Because AD cannot be cured and is degenerative the sufferer relies on others for assistance. The role of the main caregiver is often taken by the spouse or a close relative. Alzheimer's disease is known for placing a great burden on caregivers the pressures can be wide ranging involving social, psychological, physical and economic elements of the caregiver's life. In developed countries AD
