Artificial Intelligence Frontiers in Statistics D. J. Hand, 2013-08-22 **Artificial Intelligence Frontiers in Statistics** David J. Hand, 2020-11-26 This book presents a summary of recent work on the interface between artificial intelligence and statistics It does this through a series of papers by different authors working in different areas of this interface These papers are a selected and referenced subset of papers presented at the 3rd International Workshop on Artificial Intelligence and Statistics Florida January 1991 *Proceedings of Third International Conference on Computing, Communications, and Cyber-Security* Pradeep Kumar Singh, Sławomir T. Wierchoń, Sudeep Tanwar, Joel J. P. C. Rodrigues, Maria Ganzha, 2022-07-02 This book features selected research papers presented at the Third International Conference on Computing Communications and Cyber Security IC4S 2021 organized in Krishna Engineering College KEC Ghaziabad India along with Academic Associates Southern Federal University Russia IAC Educational India and ITS Mohan Nagar Ghaziabad India during October 30 31 2021 It includes innovative work from researchers leading innovators and professionals in the area of communication and network technologies advanced computing technologies data analytics and intelligent learning the latest electrical and electronics trends and security and privacy issues Artificial Intelligence in Economics and Management Phillip Ein-Dor, 2012-12-06 In the past decades several researchers have developed statistical models for the prediction of corporate bankruptcy e g Altman 1968 and Bilderbeek 1983 A model for predicting corporate bankruptcy aims to describe the relation between bankruptcy and a number of explanatory financial ratios These ratios can be calculated from the information contained in a company's annual report The is to obtain a method for timely prediction of bankruptcy a so ultimate purpose called early warning system More recently this subject has attracted the attention of researchers in the area of machine learning e g Shaw and Gentry 1990 Fletcher and Goss 1993 and Tam and Kiang 1992 This research is usually directed at the comparison of machine learning methods such as induction of classification trees and neural networks with the standard statistical methods of linear discriminant analysis and logistic regression In earlier research Feelders et al 1994 performed a similar comparative analysis The methods used were linear discriminant analysis decision trees and neural networks We used a data set which contained 139 annual reports of Dutch industrial and trading companies The experiments showed that the estimated prediction error of both the decision tree and neural network were below the estimated error of the linear discriminant Thus it seems that we can gain by replacing the traditionally used linear discriminant by a more flexible classification method to predict corporate bankruptcy The data set used in these experiments was very small however *Artificial Intelligence Frontiers in Statistics* David J. Bayesian Networks Dawn E. Holmes, 2008-10-02 Bayesian networks currently provide one of the most rapidly growing areas of research in computer science and statistics In compiling this volume we have brought together contributions from some of the most prestigious researchers in this field Each of the twelve chapters is self contained Both theoreticians and application scientists engineers in the broad area of artificial intelligence will find this volume valuable It also provides a useful sourcebook for Graduate students since it shows the direction of current research Uncertainty in Artificial

Intelligence MKP, 2014-06-28 Uncertainty Proceedings 1994 *Learning from Data* Doug Fisher, Hans-J. Lenz, 2012-12-06 Ten years ago Bill Gale of AT T Bell Laboratories was primary organizer of the first Workshop on Artificial Intelligence and Statistics In the early days of the Workshop series it seemed clear that researchers in AI and statistics had common interests though with different emphases goals and vocabularies In learning and model selection for example a historical goal of AI to build autonomous agents probably contributed to a focus on parameter free learning systems which relied little on an external analyst s assumptions about the data This seemed at odds with statistical strategy which stemmed from a view that model selection methods were tools to augment not replace the abilities of a human analyst Thus statisticians have traditionally spent considerably more time exploiting prior information of the environment to model data and exploratory data analysis methods tailored to their assumptions In statistics special emphasis is placed on model checking making extensive use of residual analysis because all models are wrong but some are better than others It is increasingly recognized that AI researchers and or AI programs can exploit the same kind of statistical strategies to good effect Often AI researchers and statisticians emphasized different aspects of what in retrospect we might now regard as the same overriding tasks

Learning in Graphical Models M.I. Jordan, 2012-12-06 In the past decade a number of different research communities within the computational sciences have studied learning in networks starting from a number of different points of view There has been substantial progress in these different communities and surprising convergence has developed between the formalisms The awareness of this convergence and the growing interest of researchers in understanding the essential unity of the subject underlies the current volume Two research communities which have used graphical or network formalisms to particular advantage are the belief network community and the neural network community Belief networks arose within computer science and statistics and were developed with an emphasis on prior knowledge and exact probabilistic calculations Neural networks arose within electrical engineering physics and neuroscience and have emphasised pattern

recognition and systems modelling problems This volume draws together researchers from these two communities and presents both kinds of networks as instances of a general unified graphical formalism The book focuses on probabilistic methods for learning and inference in graphical models algorithm analysis and design theory and applications Exact methods sampling methods and variational methods are discussed in detail Audience A wide cross section of computationally oriented researchers including computer scientists statisticians electrical engineers physicists and neuroscientists *The Ethical Frontier of AI and Data Analysis* Kumar, Rajeev, Joshi, Ankush, Sharan, Hari Om, Peng, Sheng-Lung, Dudhagara, Chetan R., 2024-03-04 In the advancing fields of artificial intelligence AI and data science a pressing ethical dilemma arises As technology continues its relentless march forward ethical considerations within these domains become increasingly complex and critical Bias in algorithms lack of transparency data privacy breaches and the broader societal repercussions of AI applications are demanding urgent attention This ethical quandary poses a formidable challenge for researchers academics and industry professionals alike threatening the very foundation of responsible technological innovation Navigating this ethical minefield requires a comprehensive understanding of the multifaceted issues at hand *The Ethical Frontier of AI and Data Analysis* is an indispensable resource crafted to address the ethical challenges that define the future of AI and data science Researchers and academics who find themselves at the forefront of this challenge are grappling with the evolving landscape of AI and data science ethics Underscoring the need for this book is the current lack of clarity on ethical frameworks bias mitigation strategies and the broader societal implications which hinder progress and leave a void in the discourse As the demand for responsible AI solutions intensifies the imperative for this reliable guide that consolidates explores and advances the dialogue on ethical considerations grows exponentially *Selecting Models from Data* P. Cheeseman, R.W. Oldford, 2012-12-06 This volume is a selection of papers presented at the Fourth International Workshop on Artificial Intelligence and Statistics held in January 1993 These biennial workshops have succeeded in bringing together researchers from Artificial Intelligence and from Statistics to discuss problems of mutual interest The exchange has broadened research in both fields and has strongly encouraged interdisciplinary work The theme of the 1993 AI and Statistics workshop was *Selecting Models from Data* The papers in this volume attest to the diversity of approaches to model selection and to the ubiquity of the problem Both statistics and artificial intelligence have independently developed approaches to model selection and the corresponding algorithms to implement them But as these papers make clear there is a high degree of overlap between the different approaches In particular there is agreement that the fundamental problem is the avoidance of overfitting Le where a model fits the given data very closely but is a poor predictor for new data in other words the model has partly fitted the noise in the original data **Business Intelligence for Enterprise Internet of Things** Anandakumar Haldorai, Arulmurugan Ramu, Syed Abdul Rehman Khan, 2020-06-09 This book discusses Internet of Things IoT as it relates to enterprise applications systems and infrastructures The authors discuss IoT and how it is disrupting

industries such as enterprise manufacturing enterprise transportation enterprise smart market enterprise utilities and enterprise healthcare They cover how IoT in the enterprise will have a major impact on the lives of consumers and professionals around the world and how it will change the way we think about professional and consumer networks The book's topics include IoT enterprise system architecture IoT enabling enterprise technologies and IoT enterprise services and applications Examples include enterprise on demand market impacts and implications on smart technologies big data enterprise management and future enterprise Internet design for various IoT use cases such as share markets healthcare smart cities smart environments smart communications and smart homes

NAVIGATING THE AI FRONTIER: UNDERSTANDING THE BENEFITS AND CHALLENGES OF ARTIFICIAL INTELLIGENCE ACROSS INDUSTRIES Dr. Arun B. Prasad, 2023-08-21. The consistent development of information technology (IT) paves the way for companies to make the shift to digital work as their principal mode of operation. This is made feasible by the rapid progress of IT. As a consequence of this, employers are putting pressure on employees to adapt to new forms of employment which may include less interaction with other people but more interaction with information technology. However, as a consequence of these new ways of doing things, workers won't be able to carry out their responsibilities with the same principles and beliefs that they have been used to bringing to the table in the past. The continual upheaval that takes place in the workplace has the potential to influence the self-beliefs that constitute a person's professional identity at work, also known as the perception of one's function in the workplace. This is because self-beliefs are

sensitive to being influenced by the perception of one's function in the workplace. The act of having one's identity questioned by an experience that is in direct opposition to who they are may result in a decline in one's sense of self-worth as well as a potential threat to the integrity of one's identity. As a consequence of this, it is possible that activities that are targeted at maintaining self-esteem connected with identity will be necessary in light of the fact that the landscape and experiences of a number of professions have been transformed as a result of the development of technology. The digitization of workplaces is directly responsible for the growing popularity of digital labour as the normal operating procedure in organisations. One of the primary factors that is driving this discussion is the continuing development of artificial intelligence (AI) which can be defined as the ability of a machine to perform cognitive functions that we associate with human minds such as perceiving, reasoning, learning, interacting with the environment, problem-solving, decision-making and even demonstrating creativity. Artificial intelligence is put to use in many different capacities within the field of digital labour including managerial decision-making, data analysis and prediction work or human-AI interaction (Pargue, 2019). Because of this, artificial intelligence will continually bring about changes to working environments and professions, perhaps putting the lives of people whose jobs are replaced by computers in jeopardy. On the other hand, this might lead to a reduction in value if the people who utilise AI systems have major variances in their perspectives. In addition, the use of AI has the potential to contribute to the growth of ambiguity and the invasion of individuals' right to personal privacy. The phrase 'dark side of AI' is often used to refer to this undesirable phenomenon which outlines the ways in which AI offers risks for individuals, businesses and society as a whole. However, the adoption of AI in enterprises may not only eliminate or modify current jobs but also create new sectors of labour such as in the disciplines of engineering, programming or even social domains. This is because AI may be able to perform some or all of the tasks associated with these vocations. This is due to the fact that AI is capable of learning new things and adjusting to its surroundings. There is an ongoing sense of optimism over artificial intelligence and the economic effects that it will have (Selz, 2020). The public discourse about artificial intelligence has been more optimistic over the last several years despite this, the concern that AI would displace current jobs continues to outweigh the potential for human and AI collaboration in the future. The interaction between humans and artificial intelligence demonstrates that people's views of AI are based on a wide variety of features to varying degrees. For example, salient signals, affordances or collaborative interaction may have an effect on a person's emotions and as a consequence, their intents about artificial intelligence (Shin, 2021). The manner in which an employee applies technology in the course of their work contributes to the formation of that employee's sense of self-identity. In order to investigate this matter in a way that is adequate, we are going to adopt the perspective of Carter and who define the word 'IT identity' as the extent to which a person views use of an IT as integral to his or her sense of self. This will allow us to investigate this matter in a manner that is adequate. It is possible that the implementation of AI in the workplace will run opposite to the employees' identification with their activities which may cause

them to engage in resistive behaviours such as an aversion to algorithms on their part The phenomenon known as algorithm aversion is characterised by the fact that employees when faced with the same conditions as before prefer to get assistance from a human being rather than from a computer programme A possible definition of IT identity danger is the anticipation of harm to an individual's self-beliefs caused by the use of an IT and the entity it applies to is the individual user of an IT The individual user of an IT is the entity to whom this definition applies A term that might be used to describe this obstruction is IT identity threat As a consequence of this having an awareness of the development of upcoming predictors that impact AI resistance based on IT identity risks is very necessary This is owing to the fact that it is anticipated that the introduction of AI would modify employment inside enterprises which in turn may have an influence on the identities of the individuals working in such firms
