Clark, 1995 A potential hydrologic effect of surface mining of coal in southeastern Montana is a change in the quality of ground water Dissolved solids concentrations in water in spoils aquifers generally are larger than concentrations in water in the coal aquifers they replaced however laboratory experiments have indicated that concentrations can decrease if ground water flows from coal mine spoils to coal This study was conducted to determine if decreases in concentrations occur onsite and if so which geochemical processes caused the decreases Solid phase core samples of spoils unmined over burden and coal and ground water samples were collected from 16 observation wells at two mine areas In the Big Sky Mine area changes in ground water chemistry along a flow path from an upgradient coal aquifer to a spoils aquifer probably were a result of dedolomitization Dissolved solids concentrations were unchanged as water flowed from a spoils aquifer to a downgradient coal aquifer In the West Decker Mine area dissolved solids concentrations apparently decreased from about 4 100 to 2 100 milligrams per liter as water moved along an inferred flow path from a spoils aquifer to a downgradient coal aquifer Geochemical models were used to analyze changes in water chemistry on the basis of results of solid phase and aqueous geochemical characteristics Geochemical processes postulated to result in the apparent decrease in dissolved solids concentrations along this inferred flow path include bacterial reduction of sulfate reverse cation exchange within the coal and precipitation of carbonate and iron sulfide minerals Proceedings of the Technology and the Mine Problem Symposium Albert M. Sky Blue Stone Arash Khazeni, 2014-05-10 This book traces the journeys of a stone across the world From its remote point of origin in the city of Nishapur in eastern Iran turquoise was traded through India Central Asia and the Near East becoming an object of imperial exchange between the Safavid Mughal and Ottoman empires Along this trail unfolds the story of turquoise a phosphate of aluminum and copper formed in rocks below the surface of the earth and its discovery and export as a global commodity In the material culture and imperial regalia of early modern Islamic tributary empires moving from the steppe to the sown turquoise was a sacred stone and a potent symbol of power projected in vivid color displays From the empires of Islamic Eurasia the turquoise trade reached Europe where the stone was collected as an exotic object from the

East The Eurasian trade lasted into the nineteenth century when the oldest mines in Iran collapsed and lost Aztec mines in the Americas reopened unearthing more accessible sources of the stone to rival the Persian blue Sky Blue Stone recounts the origins trade and circulation of a natural object in the context of the history of Islamic Eurasia and global encounters between empire and nature **Water-resources Investigations Report** ,1995 **Minerals Yearbook** ,2013
