Matsumura,2012-12-06 When first developed chlorinated pesticides such as DDT dieldrin and mirex were received with open
arms quickly becoming popular as effective economic agents against pests But evidence began to mount that residues of
these chemicals remained in the environment not breaking down often appearing in plants and animals By the late seventies
many pesticides had achieved a terrible notoriety and were subsequently banned in a number of countries Of tremendous
concern then is the persistence of pesticides in the environment The major thrust of research and development in the area of
pesticides has properly been the creation of substances that are both effective and degradable Yet in order to successfully
promote the use of biodegradable pesticides one must fully understand the mechanism of degradation and it is to this vital
subject that we address ourselves in the present volume According to the Biodegradation Task Force Safety of Chemicals
Com mitte Brussels 1978 biodegradation may be defined as the molecular degradation of an organic substance resulting
from the complex action of living organisms A substance is said to be biodegraded to an environmentally acceptable extent
when environmentally undesirable properties are lost Loss of some characteristic function or property of substance by
biodegradation may be referred to as biological transformation **Report and Recommendations** Kansas. Legislature.
