Mathematical Constants Steven R. Finch, 2003-08-18 Steven Finch provides 136 essays each devoted to a mathematical constant or a class of constants from the well known to the highly exotic This book is helpful both to readers seeking information about a specific constant and to readers who desire a panoramic view of all constants coming from a particular field for example combinatorial enumeration or geometric optimization Unsolved problems appear virtually everywhere as well This work represents an outstanding scholarly attempt to bring together all significant mathematical constants in one place

Hardy Inequalities on Homogeneous Groups Michael Ruzhansky, Durvudkhan Suragan, 2019-07-02 This open access

book provides an extensive treatment of Hardy inequalities and closely related topics from the point of view of Folland and Stein's homogeneous Lie groups. The place where Hardy inequalities and homogeneous groups meet is a beautiful area of mathematics with links to many other subjects. While describing the general theory of Hardy Rellich Caffarelli Kohn Nirenberg Sobolev and other inequalities in the setting of general homogeneous groups, the authors pay particular attention to the special class of stratified groups. In this environment, the theory of Hardy inequalities becomes intricately intertwined with the properties of sub Laplacians and subelliptic partial differential equations. These topics constitute the core of this book and they are complemented by additional closely related topics such as uncertainty principles, function spaces on homogeneous groups, the potential theory for stratified groups and the potential theory for general Hörmander's sums of squares and their fundamental solutions. This monograph is the winner of the 2018 Ferran Sunyer i Balaguer Prize, a prestigious award for books of expository nature presenting the latest developments in an active area of research in mathematics. As can be attested as the winner of such an award, it is a vital contribution to literature of analysis, not only because it presents a detailed account of the recent developments in the field, but also because the book is accessible to anyone with a basic level of understanding of analysis. Undergraduate and graduate students as well as researchers from any field of mathematical and physical sciences related to analysis involving functional inequalities or analysis of homogeneous groups will find the text beneficial to deepen their understanding.

Upper Bounds for Grothendieck Constants, Quantum Correlation Matrices and CCP Functions Frank Oertel, 2024-09-12. This book concentrates on the famous Grothendieck inequality and the continued search for the still unknown best possible value of the real and complex Grothendieck constant, an open problem since 1953. It describes in detail the state of the art in research on this fundamental inequality, including Krivine's recent contributions and sheds light on related questions in mathematics, physics and computer science, particularly with respect to the foundations of quantum theory and quantum information theory. Unifying the real and complex cases as much as possible, the monograph introduces the reader to a rich collection of results in functional analysis and probability. In particular, it includes a detailed self-contained analysis of the multivariate distribution of complex Gaussian random vectors. The notion of Completely Correlation Preserving CCP functions plays a particularly important role in the exposition. The prerequisites are a basic knowledge of standard functional analysis, complex analysis, probability, optimisation and some number theory and combinatorics. However, readers missing some background will be able to consult the generous bibliography, which contains numerous references to useful textbooks. The book will be of interest to PhD students and researchers in functional analysis, complex analysis, probability, optimisation, number theory and combinatorics in physics, particularly in relation to the foundations of quantum mechanics and in computer science, quantum information and complexity theory.

Mathematical Constants II Steven R. Finch, 2003. Famous mathematical constants include the ratio of circular circumference to diameter $\pi \approx 3.14$ and the natural logarithm base $e \approx 2.718$. Students and professionals can often name a

few others but there are many more buried in the literature and awaiting discovery How do such constants arise and why are they important Here the author renews the search he began in his book *Mathematical Constants* adding another 133 essays that broaden the landscape Topics include the minimality of soap film surfaces prime numbers elliptic curves and modular forms Poisson Voronoi tessellations random triangles Brownian motion uncertainty inequalities Prandtl Blasius flow from fluid dynamics Lyapunov exponents knots and tangles continued fractions Galton Watson trees electrical capacitance from potential theory Zermelo's navigation problem and the optimal control of a pendulum Unsolved problems appear virtually everywhere as well This volume continues an outstanding scholarly attempt to bring together all significant mathematical constants in one place

Linear and Quasi-linear Evolution Equations in Hilbert Spaces Pascal Cherrier, Albert Milani, 2022-07-14 This book considers evolution equations of hyperbolic and parabolic type These equations are studied from a common point of view using elementary methods such as that of energy estimates which prove to be quite versatile The authors emphasize the Cauchy problem and present a unified theory for the treatment of these equations In particular they provide local and global existence results as well as strong well posedness and asymptotic behavior results for the Cauchy problem for quasi linear equations Solutions of linear equations are constructed explicitly using the Galerkin method the linear theory is then applied to quasi linear equations by means of a linearization and fixed point technique The authors also compare hyperbolic and parabolic problems both in terms of singular perturbations on compact time intervals and asymptotically in terms of the diffusion phenomenon with new results on decay estimates for strong solutions of homogeneous quasi linear equations of each type This textbook presents a valuable introduction to topics in the theory of evolution equations suitable for advanced graduate students The exposition is largely self contained The initial chapter reviews the essential material from functional analysis New ideas are introduced along with their context Proofs are detailed and carefully presented The book concludes with a chapter on applications of the theory to Maxwell's equations and von Karman's equations
