Hafez, William Edward Tavernetti, 2019 This book is written to introduce computer simulations to undergraduate college students freshmen to seniors in STEM fields The book starts with concepts from Basic Mathematics Geometry Algebra and Calculus Properties of Elementary Functions Polynomials Exponential Hyperbolic and Trigonometric Functions are studied and simple differential equations representing these functions are derived Numerical approximations of first and second order differential equations are studied in terms of finite differences on uniform grids Computer solutions are obtained via recursive relations or solutions of simultaneous algebraic equations Comparisons with the exact solutions known a priori allow the calculations of the error due to discretization After the students build confidence in this approach more problems where the solutions are not known a priori are tackled with applications in many fields Next the book gradually addresses linear differential equations with variable coefficients and nonlinear differential equations including problems of bifurcation and chaos Applications in Dynamics Solid Mechanics Fluid Mechanics Heat Transfer Chemical Reactions and Combustion are included Biographies of 50 pioneering mathematicians and scientists who contributed to the materials of the book are briefly sketched to shed light on the history of these STEM fields Finally the main concepts discussed in the book are summarized to make sure that the students do not miss any of them Also references for further readings are given for interested readers **Decide-P/Om** Thomas R. Computer Simulation and Modeling Richard S. Lehman, 1977 Introduces logic methods of computer simulation modeling for the social behavioral scientist Focuses on simulation as a tool for investigation *Proceedings of the ... Summer Computer Simulation Conference* Summer Computer Simulation Conference, 1987 *A new methodology for computer simulation* Martin Greenberger, 1964 Computer simulation is a cooperative venture between researcher and information processor but the processor's role customarily begins too late The researcher can benefit substantially by bringing the computer up into the earlier creative phases of the simulation process An on line computer system that makes this possible is described The OPS system is open ended and modular in a very fundamental sense The user can add his own

parts over a period of days or months as he increases his understanding of his problem. The OPS system is relatively free of rules and formats. The user creates his own language and his own conventions. He has the widest latitude to express his problem in its natural terms and to be inventive. Gradually his system takes on an individual character appropriate to the purpose it is to serve. The user can create his own symbols and his own mapping of common storage by means of standard operators. He can also create his own operators and add them without limit to the set of standard operators supplied to him. Operators are functional subroutines programmed in any language that the computer can compile such as FORTRAN, MAD, or FAP. OPS 2 provides the user with a simple mechanism for compounding operators or creating KOPs. A KOP table in common storage has one line for each operator in the concatenation of operators that the user forms.
