

Definition

Cystic fibrosis is a hereditary disease which affects the respiratory and digestive system. The body produces thick and sticky mucus that can block the lungs and obstruct the pancreas.

Symptoms

- Very Salty sweat
- Persistent coughing with thick mucus
- Shortness of breath
- Wheezing
- Poor weight gain despite normal appetite
- Poor height growth
- Bulky foul-smelling bowel movement or diarrhea
- Frequent lungs infection or pneumonia
- Small fleshy growth found in the nose
- Fatigue

Causes

- It is mainly hereditary and occurs in a child when both parents have defective genes or the gene that carrying cystic fibrosis disease
- The defective gene has codes for the production of proteins that controls the flow of salt and water of the organs including lungs and pancreas.
- Due to the defective gene, salt balance is disturbed and low salt and water content is present outside the cell producing thicker and stickier mucus.

Possible methods to treat CF

How a person gets CF

To have CF, you must inherit two copies of the CFTR gene that contain mutations - one copy from each parent. That means that each parent either has CF or is a carrier of CFTR gene mutation.

When two people who are carrier have a child, there is 25% chance of having a child with CF

When one parent has CF and one parent is a carrier, there is 50% chance of having a child with CF

If two carriers have a child then the probability of the child being affected is:

- 25 %, or 1 in 4, chance the child will have CF
- 50%, or 1 in 2, chance the child will be a carrier but will not have CF
- 25 %, or 1 in 4, chance the child will not be a carrier and will not have CF

Reduce the Risk

Diagnosis of CF

1. Sweat Chloride Test
2. Genetic testing
3. Newborn Screening
