Cytotoxic T Cells Biology And Relevance To Disease:

Novel therapies for indolent lymphomas in the cellular therapy era Narendranath Epperla, Sairah Ahmed, 2023-11-06

Pathways for Cytolysis Gillian M. Griffiths, Jürg Tschopp, 2012-12-06 At first glance the destruction of a target cell by a killer cell seems to be a simple endeavor. A closer look however reveals the complex mechanisms underlying this task. Killer cells are able to specifically recognize altered or infected cells. A transient contact with target cells has to be established to allow the delivery of lethal molecules or signals. The killer cell then disengages from the damaged cell and moves away to kill other target cells. After the eradication of the target cells the number or activity of activated killer cells has to be reduced to avoid nonspecific killing of innocent cells. In 1992 Herman Eisen concluded in his introductory remarks in the most recent volume on lymphocyte cytotoxicity EISEN 1993. Given the immense amount of effort made in the past decade to understand these lytic mechanisms it seems surprising that a consensus about the principal mechanisms has not been reached. Since that time advances made in the field of cell mediated cytotoxicity are so significant that our knowledge regarding the lytic mechanisms has been considerably augmented. Much of this is due to studies with transfectants and mutants either naturally occurring or generated by gene targeting. It is now clear that there are two predominant pathways which act hand in hand and lead to efficient target cell destruction.

Natural Killer T cells Masaki Terabe, Jay A. Berzofsky, 2011-09-22 This book will cover primary roles of NKT cells in immunity to cancer in both mouse tumor models and cancer patients. There are several chapters describing general aspects of NKT cells.

Epstein-Barr Virus and Associated Diseases P.H. Levine, D.V. Ablashi, G.R. Pearson, S.D. Kottaridis, 2012-12-06 It has been slightly more than two decades since the Epstein Barr virus (EBV) was discovered by Prof M A Epstein and his colleagues at the University of Bristol in their search for the causative agent of Burkitt's lymphoma. For several years EBV was a virus in search of a disease. The first documentation that EBV was pathogenic for humans was in 1969 when Drs Gertrude and Werner Henle identified it as the causative agent for infectious mononucleosis. Seroepidemiologic and biochemical studies subsequently linked EBV to Burkitt's lymphoma, B-cell nasopharyngeal carcinoma (NPC) and more recently to the X-linked lymphoproliferative syndrome. With its widespread pattern of infection and a predilection for producing clinical signs and symptoms in only certain individuals EBV has provided a model for many other candidate oncogenic viruses including papilloma viruses, herpes simplex and HTLV. In 1975 an international workshop was sponsored by the National Cancer Institute to address the problem of EBV production thus facilitating basic research on the virus. This proved to be the last international meeting on EBV for almost a decade. In the past progress in both clinical and basic research on EBV has been presented in two types of international meetings: the international herpesvirus workshops devoted primarily to basic research on both human and animal herpesviruses and the international symposia on NPC in which EBV related studies were interspersed with clinical epidemiologic and other etiologic

Mathematical Modeling of the Immune System in Homeostasis, Infection and Disease Gennady Bocharov, Burkhard Ludewig, Andreas Meyerhans, Vitaly Volpert, 2020-02-24 The immune system provides the host organism with defense mechanisms against invading pathogens and tumor development and it plays an active role in tissue and organ regeneration Deviations from the normal physiological functioning of the immune system can lead to the development of diseases with various pathologies including autoimmune diseases and cancer Modern research in immunology is characterized by an unprecedented level of detail that has progressed towards viewing the immune system as numerous components that function together as a whole network Currently we are facing significant difficulties in analyzing the data being generated from high throughput technologies for understanding immune system dynamics and functions a problem known as the curse of dimensionality As the mainstream research in mathematical immunology is based on low resolution models a fundamental question is how complex the mathematical models should be To respond to this challenging issue we advocate a hypothesis driven approach to formulate and apply available mathematical modelling technologies for understanding the complexity of the immune system Moreover pure empirical analyses of immune system behavior and the system's response to external perturbations can only produce a static description of the individual components of the immune system and the interactions between them Shifting our view of the immune system from a static schematic perception to a dynamic multi level system is a daunting task It requires the development of appropriate mathematical methodologies for the holistic and quantitative analysis of multi level molecular and cellular networks Their coordinated behavior is dynamically controlled via distributed feedback and feedforward mechanisms which altogether orchestrate immune system functions The molecular regulatory loops inherent to the immune system that mediate cellular behaviors e g exhaustion suppression activation and tuning can be
