German Histories in the Age of Reformations, 1400-1650 Thomas A. Brady Jr., 2009-07-13 This book studies the connections between the political reform of the Holy Roman Empire and the German lands around 1500 and the sixteenth century religious reformations both Protestant and Catholic It argues that the character of the political changes dispersed sovereignty local autonomy prevented both a general reformation of the Church before 1520 and a national reformation thereafter The resulting settlement maintained the public peace through politically structured religious communities confessions thereby avoiding further religious strife and fixing the confessions into the Empire s constitution The Germans emergence into the modern era as a people having two national religions was the reformation s principal legacy to modern Germany

The Open Challenges of Cognitive Frailty: Risk Factors, Neuropsychological Profiles and Psychometric Assessment for Healthy Aging Simone Varrasi, Sabrina Castellano, Daniele Magistro, 2025-09-26 Frailty is a multidimensional geriatric syndrome characterized by increased vulnerability to stressors When physical frailty is associated with Mild Cognitive Impairment MCI but not dementia the definition of cognitive frailty is preferred The use of the term cognitive frailty is based on a long series of research on the association between multimorbidity and MCI allowing for a single definition to encompass the coexistence of physical and cognitive impairment This gives useful insights on the holistic processes of aging Several aspects of cognitive frailty remain unexplored particularly in comparison to physical frailty with no consensus on its prevention functioning and measurement The lack of agreement hinders the development of effective support strategies For instance a variety of studies investigated the modifiable health and psychosocial risk factors leading to the transition to cognitive frailty nutrition sleep depression social contacts sensory impairments risky habits and so on Results are still mixed Even the neuropsychological functioning has not been thoroughly described and the definition of cognitive profiles of frailty has been left to screening tests only The need for more specific distinctive cognitive markers is closely related to the necessity for dedicated diagnostic tools However these tools are not available due to the lack of a consensus on the multidimensional concept of frailty itself which encompasses

sociodemographic physical cognitive psychological nutritional social aging and disease domains Each of them should be considered in effective community dwelling based psychometric tools The ambitious goal for up to date research therefore is to address all these gaps for healthy aging The Role of Glia in Alzheimer's Disease Beatriz G. Perez-Nievas,Alberto Serrano-Pozo,2019-03-20 We believe that the role of glia is the next frontier to be explored in Alzheimer s disease research This eBook is an update on both the current knowledge of astrocytes and microglia involvement in Alzheimer s disease pathophysiology and some of the techniques available to study them Neuroimaging and Informatics for Successful Aging Toshiharu Nakai,Eric Tatt Wei Ho,Henning Müller,Fanpei G. Yang,Hanna Lu,2022-09-02 Greenfield's Neuropathology, 2-Volume Set, Eighth Edition Seth Love,David Louis,David W Ellison,2008-02-29 Greenfield s Neuropathology the worlds leading neuropathology reference provides an authoritative comprehensive account of the pathological findings in neurological disease their biological basis and their clinical manifestations This account is underpinned throughout by a clear description of the molecular and cellular processes and reactions that are relevant to the development and normal and abnormal functioning of the nervous system While this scientific content is of paramount importance however care has been taken to ensure that the information is presented in a way that is accessible to readers working within a range of disciplines in the clinical neurosciences and that also places the neuropathological findings within the context of a broader diagnostic process The new eighth edition incorporates much new information new illustrations and many new authors while retaining the depth breadth and quality of content so praised in previous editions Each chapter opens with an introductory section designed to offer an integrated approach to diagnosis taking account of clinical manifestations neuroradiological and laboratory findings as well as the neuropathological and molecular genetic features of the diseases being considered Strong emphasis has been placed on facilitating the retrieval of neuropathological information by non neuropathologists grappling with differential diagnoses or seeking information on broad categories of neurological disease and boxes and tables are used to present important symptoms and signs patterns of disease and other features for ease of reference High quality line and photographic illustrations the majority in full colour are all available on a companion CD to complete the offering

responses within the brain are still scarcely explored Nerve tissue damage is accompanied by the activation of glial cells primarily microglia and astroglia and such activation is responsible for the release of cytokines and chemokines that maintain the local inflammatory response and actively recruit lymphocytes and monocytes to the damaged areas Theoretically these responses are designed to repair the brain damage However alterations or a chronic perpetuation of these responses may underlie a number of neuro pathologies It is thought that each inflammatory scenario within the brain have a specific biochemical footprint characterized by the release of determined cytokines chemokines and growing factors able to define particular immunological responses Alongside glial cells transform their cell body become larger and develop higher number of branches adopting an active morphological phenotype These changes are related with the search of interactions with other cells such as bystander resident cells of the brain parenchyma but also cells homing from the blood stream In this process microglia and astrocytes communicates with other cells by the formation of specific intercellular connections that are still poorly understood These interactions are complex and entail the arrangement of cytoskeletal compounds secretory and phagocytic domains In this particular crosstalk there is a two way communication in which glial cells and target cells come together establishing interfaces with specific information exchange This way glial cells orchestrate the particular response recruiting cellular subsets within the central nervous system and organizing the resolution of the brain damage In this Frontiers Research Topic we compile a selection of articles unfolding diverse aspects of glial derived inflammation focused on neurodegenerative diseases and other nervous system disorders with special emphasis on microglia macrophages as leading actors managing neuro immunity
