Agricultural Technology In The Twentieth Century:

Agricultural Technology in the Twentieth Century, 1991 *Agricultural Technology in the Twentieth Century* R. Douglas Hurt, 1991 **Studies in Agricultural Technology in Nineteenth- and Twentieth-century England** Paul William Brassley, 2001

Four published papers and several parts of a book are presented herein together with a previously unpublished short paper explaining the intellectual background against which they were written and summarising their findings on the development of agricultural technology in England in the nineteenth and twentieth centuries. This outlines the contribution of economic and sociological theories to the study of technical change but makes the point that historical studies although clearly influenced by these theories tend to use a multifactorial approach which avoids privileging any single explanation. Nevertheless several themes arising in all of this material are identified especially the gap between innovation and the adoption of technology and the influence upon it of scientific, systemic and socio-economic changes.

Brassley 1995a examines the criteria against which the success of agricultural science should be judged and concludes that for most of the nineteenth century in Britain it was a failure. It identifies the establishment of the university departments of agriculture in the 1890s and the Development Commission in 1910 as the main factors which reversed this trend and in an appendix examines the impact of changing output prices upon the supply curve. In Brassley 1995b the life of a single farmer, Primrose McConnell, is considered. In adoption-diffusion theory terms McConnell is a classic example of an innovator and this paper reveals the various ways in which as a writer and a practising farmer he influenced the agricultural industry of the late nineteenth and early twentieth centuries. Brassley 1996 concentrates on a single example of technical change in this case silage and explains why its widespread adoption took about a hundred years. The principal conclusion is that silage like many examples of agricultural technology is not a single change but a complex system of interacting individual components all of which need to be available or in place before widespread adoption can occur. The significance of this process is studied in Brassley 2000a which examines the relationship between technical change and output in the late nineteenth and twentieth centuries and concludes that innovation was not necessarily as important as the adoption of pre-existing technology in accounting for output expansion. Brassley 2000b is divided into three parts. The first introduces the concept of farming systems in late nineteenth century England and Wales and analyses the principal arable and pastoral systems of the period. The second examines individual aspects of farming technology with the exception of farm buildings and machinery and the third traces the development of agricultural science and education in England and Wales between 1850 and 1914. Clearly these three are inter-related in that science and education had some impact on techniques which in turn influenced farming systems but one of the main themes to emerge from this study as from the other papers in this collection is the restricted rate of change and the gap between technical leaders and laggards.
