Air pollution is known to be a risk factor for personal health and an important determinant of various diseases Numerous studies exist that examine the effects of an increase in air pollution on the risk of disease and mortality from cardiovascular and cardiopulmonary causes One possible way to quantify air pollution is to measure the concentration of particles with a specific diameter between 2.5 and 10 micrometers are referred to as PM10 The authors assess the effects of air pollutants PM10 on hospital admissions for respiratory diseases in Egypt in 2016 They use a retrospective design and employ a generalized additive model GAM to conduct our analysis Daily hospital admission data for Chronic Obstructive Pulmonary Disease COPD and chronic bronchitis were collected from specialized chest hospitals and matched to air pollution data The results suggest that the concentration of PM10 in the air is an important predictor of respiratory disease The authors find that a 10 ug

and personal health data The model s predictive accuracy offers a proactive tool for public health interventions allowing for targeted health advisories and personalized prevention strategies The findings enhance our understanding of air pollution s multifaceted effects on respiratory health providing crucial evidence to guide effective policy measures and improve health outcomes in affected populations **Air Pollution and Lung Disease in Adults** Philip Witorsch, Samuel V.
