Remediation Effects on the Structure and Activity of Soil Microbial Communities M.V. Bindu, V.S.

Harikumar, 2016-05-27 Soil can be defined as the space time continuum forming the upper part of the earth's crust It is a natural body comprised of solid liquid and gases that occur on the land surface Joffe 1949 defined soil as a natural body differentiated into horizons of mineral and organic constituents usually unconsolidated of variable depth which differs from the parent material below in morphology physical properties and constitution chemical properties and composition and biological characteristics Soil is one of the most fundamental resources for sustainability and survival It is one of the most important assets to protect and pass on to future generations Soil contamination due to anthropogenic and natural sources is increasing day by day because of increasing population industrialization and urbanization Soil is the receptor of many

contaminants from various sources Contamination decreases the quality of the soil and adversely affects soil organisms For this study soil samples from thirteen locations contaminated from agricultural industrial and organic sources spread over the districts of Alappuzha and Kottayam in Kerala in the south west coast area of India were analyzed to study the changes in soil characteristics and its influence on soil microbial communities and their activities

Phytoremediation of Hydrocarbon-Contaminated Soils Stephanie Fiorenza,Carroll L. Oubre,C. H. Ward,2020-12-17 Interest in phytoremediation as a solution for contaminants in groundwater and soil has exploded The project documented in Phytoremediation of Hydrocarbon Contaminated Soils presents innovative technology for environmental clean up using in situ treatment It describes the results of a field study focusing on hydrocarbon contamination especially polynuclear aromatic hydrocarbons in surface and near surface soils The field demonstration used soils contaminated with aged diesel fuels The random block design enabled the investigators to test the statistical difference in the effects of different vegetated and unvegetated treatments They tested the degradation of diesel and polynuclear aromatic hydrocarbon components in plots containing three different vegetation treatments two grasses and a legume and a non vegetated control Part one of the monograph gives a complete and thorough account of the results of the field study Part two covers the design and potential costs of a full scale implementation of the demonstration system as well as the performance and potential application of the new technology Phytoremediation of Hydrocarbon Contaminated Soils supplies quantitative results about the use of vegetation in soil remediation The information given on the niches and limitations of the technologies allows for a more informed selection of remedial solutions for environmental cleanup
