## Abstract

Scholarship on contaminated communities has highlighted how residents living with the reality of significant environmental hazards often experience similar negative psychosocial stressors. However, relatively less is known about the mitigating factors that can explain divergence in these impacts such as levels of community efficacy and empowerment. This is critical as insight into these dynamics can provide answers as to why certain communities maintain a sense of efficacy whereas others do not. To address this question, we conduct a comparative analysis of two heavily contaminated communities in Oklahoma and Colorado. Our data come from extensive fieldwork, including in-depth interviews ( $n = 105$ ) and participant observation. Our findings revealed a set of similar psychosocial outcomes in the two communities, but we argue that specific revitalizing events in one community played a crucial role in sustaining residents' feelings of empowerment and persistence. Our paper concludes with a discussion of the implications of our research for future work on contaminated communities, technological disasters, and citizen participation.

## 1 Introduction

Extant research on contaminated communities has identified a number of psychosocial impacts associated with living near environmental hazards (e.g., Crighton et al. 2003; Edelman 2018; Kroll-Smith and Couch 1991; Zhuang et al. 2016). While much of this work has established how communities often experience similar impacts in cases of chronic contamination and environmental threat, relatively less is known about the factors that explain

**Handbook of Disaster and Emergency Management (Second Edition)** Amir Khorram-Manesh, Krzysztof Goniewicz, Attila Hertelendy, Maxim Dulebenets, 2021-10-06 Disasters and public health emergencies are increasing Climate change transportation incidents increasing numbers of mass gatherings chemical and technical incidents increasing number of armed conflicts and terrorism are some of the major reasons for this increasing pattern Any of these events may result in severe casualties destruction of infrastructures and create a situation in which the number of victims may exceed available resources Much of the knowledge in disaster medicine is based on the lessons learned However it has been proven that no lessons learned theoretically can be of practical use if the knowledge is not tested in an appropriate environment In this perspective the major clinical excellence and testing laboratories for disaster response are the scenes where disasters

happen Yet most of the research and reports in the field are produced in high income countries while most of the disasters happen in middle or low income countries There is thus a need to bring these two environments together in order to translate theory into practice and among people who are highly exposed and involved in the multidisciplinary management of a disaster or major incident
