Clinical Approach to Infection in the Compromised Host R. Rubin, 2013-11-11 Infection in the Compromised Host has become a classic chapter in textbooks devoted to infectious diseases and internal medicine The numbers of compromised hosts are increasing in the era of modern medicine because of our expanded capabilities to deal with difficult diseases especially neoplasms As a consequence microbiologic complications related to the intensive care administered to these patients are increasing as well Under these circumstances not only does the underlying illness create conditions favorable for the development of unusual infections but often the therapy contributes to the acquisition of potential pathogens that turn into agents responsible for severe and frequently fatal disease Granulocytopenia and immunosuppression have been the two key factors in predisposing patients with cancer and other serious diseases to severe bacterial infections Colonization by hospital acquired pathogens and breaks in the anatomic barriers as a result of disease or medical intervention have contributed to the high incidence of infectious diseases in these patients Although there is some overlap between the types of infection in granulocytopenic and immunosuppressed hosts each of these clinical entities has distinctive features that justify considering them separately reserving the term immunocompromised hosts only when referring to patients who are predisposed to opportunistic infections For about two decades infections in granulocytopenic patients have attracted the attention of clinicians because they represent a model for the study of antimicrobial drugs in hosts deprived of an essential element of defense against bacterial infection that is an adequate number of normally functioning granulocytes
