Cybernetics in Water Resources Management Branislav Djordjevic, 1994-06-30 **Cybernetics and the Constructed Environment** Zihao Zhang, 2024-07-25 Grounded in contemporary landscape architecture theory and practice Cybernetics and the Constructed Environment blends examples from art design and engineering with concepts from cybernetics and posthumanism offering a transdisciplinary examination of the ramifications of cybernetics on the constructed environment Cybernetics or the study of communication and control in animals and machines has grown increasingly relevant nearly 80 years after its inception Cyber physical systems sensing networks and spatial computing algorithms and intelligent machines create endless feedback loops with human and non human actors co producing a cybernetic environment Yet when an ecosystem is meticulously managed by intelligent machines can we still call it wild nature Posthumanism ideas such as new materialism actor network theory and object oriented ontology have become increasingly popular among design disciplines including landscape architecture and may have provided transformative frameworks to understand this entangled reality However design still entails a sense of intentionality and an urge to control How do we then address the tension between the designer s intentionality and the co produced reality of more than human agents in the cybernetic environment Is posthumanism enough to develop a framework to think beyond our all too human ways of thinking For researchers scholars practitioners and students in environmental design and engineering disciplines this book maps out a paradigm of environmentalism and ecological design rooted in non communication and uncontrollability and puts a speculative turn on cybernetics Chapters 8 and 9 of this book are freely available as a downloadable Open Access PDF at <http://www.taylorfrancis.com> under a Creative Commons Attribution Non Commercial No Derivatives CC BY NC ND 4.0 license

Engineering Risk in Natural Resources Management L. Duckstein, E. Parent, 2013-11-11 The purpose of this paper is to present a methodology for estimating space time stochastic properties of local climatic factors reflecting global climate change Specifically daily precipitation amount and daily mean temperature are considered and illustrated with application to the state of Nebraska U S A Furthermore a drought index with and without global climate change is examined The magnitude and consequences of regional response to anticipated climatic changes are uncertain Houghton et al 1990 Typical questions to be answered are can time series of hydrological events or 10cl climatic variables such as daily temperature be conditioned in scenarios of future climate change and if so how can this be utilized Can extreme historical drought events be reproduced by a stochastic hydroclimatological model Can such a model be used with General Circulation Model GCM outputs to evaluate the regional local effects of climate change scenarios The approach presented in this paper is an extension of the usual analysis of regional hydrometeorological impacts of climate change we propose to examine time series of GCM produced daily atmospheric circulation patterns CP thought to be relatively accurate GCM output to estimate local climatic factors The paper is organized as follows First daily CPs are classified and analyzed statistically first for historical and then for GCM produced data Next the height of the 500 hPa pressure field is introduced as an additional physically

relevant variable influencing local climatic factors within each CP type
