

Milankovitch cycles influence climate

- **Milankovitch cycles** = periodic changes in Earth's rotation and orbit around the sun
 - Alter the way solar radiation is distributed over Earth
- These cycles modify patterns of atmospheric heating
 - Triggering climate variation
 - For example, periods of cold *glaciation* and warm *interglacial* times

(a) Axial wobble

(b) Variation of tilt

(c) Variation of orbit

Life/Death Rhythms of Ancient Empires - Climatic Cycles Influence Rule of Dynasties Will Slatyer, 2014 The Life Death Rhythms of Ancient Empires outlines the flow of history from 3000BC to 1400AD to identify the factors that make up dominant just prosperous civilisations that can be described as golden cultures These factors were found to have common features and the cultures themselves could be described in cyclical terms This meant that the rise and fall of future dominant cultures could be roughly forecast to some degree in terms of hundreds of years The evolution of capitalism was made possible during and after actual warfare by ancient priests and bankers assisted by the invention of coinage Capitalism was practised in the ancient world supported at times by warfare and religion It was vanquished for centuries by powerful weapons called irresponsible debt and debasement of currency The global capitalism of the twenty first century is dependent on debt and a debased US dollar A review of ancient history provides the basis for a glimpse into the future This century's global temperature increase which so excites environmentalists can be shown to be part of a thousand year climate cycle There well might be a human element to global warming but this just exacerbates the centuries long cyclical pattern Research has shown that periods of hot dry and cold dry climate have effects on human behaviour Extrapolation of cycles enables forecasts of human behaviour to be made well into the new millennium Dominant prosperous societies have occurred at roughly 200 year intervals which can suggest time lines for societies in the present and the future A relatively irreverent history of ancient cultures war religion money and debt produces cyclical analysis enabling a forecast that the USA might lose world dominance in 2040 The next volume Life Death Rhythms from the Capitalist Renaissance will include economic data that will allow refined cyclical forecasts

New Directions and Perspectives Belinda Pletzer, 2015 This research topic aims to integrate scattered findings on sex differences in neuroscience into a broader theory of how the human brain is shaped by sex and sex hormones in order to cause the great variety of sex differences that are commonly observed It can be assumed that these differences didn't occur arbitrarily but that they rather determined and still determine evolutionary success of individuals and were shaped by the processes of natural and in particular sexual selection Therefore sex differences are not negligible and sex difference research cannot be discriminating against one sex or the other In fact a better understanding of the underlying causes of sex differences has great advantages for both men and women and society as a whole not only in terms of health care but in every aspect of life Gender equality can only work out if it is equally well understood for men and women what their individual resources and needs are Therefore it is of great importance to pave the way for identifying the underlying principles of structural and functional brain organization that cause men and women to act think and feel differently To this end it is of particular interest to identify possible similarities and interrelations between sex differences that did so far stand separately in order to investigate whether they share a common source To understand where a specific sex difference comes from and whether or not it is caused by the same principle as other sex differences it is necessary to explicitly link sex differences in behavior to their neuronal correlates and vice versa link sex differences in brain structure and function to their behavioral outcomes In particular a new understanding of male and female brain functioning may arise from findings on how sex hormones interact with various neurotransmitter systems In the past few years several findings demonstrated that women's behavior is influenced by the sex hormone fluctuations they experience naturally during their menstrual cycle to the extent that sex differences may only be detectable in one cycle phase but not another The study of menstrual cycle dependent effects gives important hints about which sex differences are activational and which are organizational Additionally it only recently came to attention that hormonal contraception may alter a woman's mood cognition and behavior as a consequence of changes in brain structure and function The underlying mechanisms are so poorly understood that it is even hard to predict whether hormonal contraception will mask or amplify sex differences in a given task Since the oral hormonal contraceptive pill is meanwhile used by 100 million women worldwide and even by teenagers whose brains are not yet fully developed the question of how the synthetic steroids contained in hormonal contraceptives act on the brain is to be studied hand in hand with naturally occurring sex differences This topic summarizes the current state of the art in sex difference research and gives new perspectives in terms of hypothesis generation and methodology Both are necessary to gain a complete picture of what it is that makes a brain male or female and move towards a neuroscience of sex differences
