Cyclization Reactions:

Cyclization Reactions C. Thebtaranonth, Yodhathai Thebtaranonth, 1993-05-01 Cyclization Reactions provides a quick update of the latest advances in cyclization reactions. It covers the basic principles of cyclization chemistry emphasizing practical applications. Chapters are organized according to the different cyclization intermediates: cationic, radical, anionic, and metal complex intermediates. The last chapter covers macrolactonization, vicinal tricarbonals, and Bergman enediyne reactions, which are of particular interest today. More than 2 600 structures illustrate key concepts throughout the book. Various cyclizations are organized into mechanistic groups to help researchers choose and change between methods when searching for maximum efficiency in synthesis. Critical coverage of the literature up to 1992 is provided. Cyclization Reactions is essential reading for anyone involved in the synthesis of ring compounds or who is seeking a rapid overview of the field. Newcomers as well as experienced researchers will benefit from this book. It also is excellent reference material for students at the advanced undergraduate and graduate levels. *Handbook of Cyclization Reactions* Shengming Ma, 2010 The ultimate and only reference source in this field, this handbook discusses the latest advances on the reactions leading to the formation of cyclic structures and includes chapters presenting the most synthetically attractive cyclization reactions. Leading chemists from around the world provide authoritative first-hand information, including experimental procedures that offer readers valuable practical information that is otherwise unavailable. An aid for every organic chemist in grasping and applying these new reactions. Publisher's website. *Radicals* Nonhebel, Tedder, Walton, 1979-06-07

Asymmetric Metal Catalysis in Enantioselective Domino Reactions Helene Pellissier, 2019-11-11 Introduces an innovative and outstanding tool for the easy synthesis of complex chiral structures in a single step. Covering all of the literature since the beginning of 2006, this must-have book for chemists collects the major progress in the field of enantioselective one-, two-, and multicomponent domino reactions promoted by chiral metal catalysts. It clearly illustrates how enantioselective metal-catalyzed processes constitute outstanding tools for the development of a wide variety of fascinating one-pot asymmetric domino reactions, thereby allowing many complex products to be easily generated from simple materials in one step. The book also strictly follows the definition of domino reactions by Tietze as single-, two-, as well as multicomponent transformations. *Asymmetric Metal Catalysis in Enantioselective Domino Reactions* is divided into twelve chapters dealing with enantioselective copper, palladium, rhodium, scandium, silver, nickel, gold, magnesium, cobalt, zinc, yttrium, and ytterbium and other metal-catalyzed domino reactions. Most of the chapters are divided into two parts dealing successively with one- and two-component domino reactions and three-component processes. Each part is subdivided according to the nature of domino reactions. Each chapter of the book includes selected applications of synthetic methodologies to prepare natural and biologically active products. Presents the novel combination of asymmetric metal catalysis with the concept of fascinating domino reactions, which allows high molecular complexity with a remarkable level of enantioselectivity. Showcases an incredible tool synthesizing complex and diverse chiral
