

through stimulation of the nerves), prevents disease (by aiding elimination through intra-abdominal pressure) and activates the bioenergy potential or *Kundalini* through direct influence upon the various plexuses, nerves and nerve cells). Relief from flatulence and abdominal adhesions may also be sought through this pose. In order to avoid any injury, however, it is advisable for the weak to obtain only a modicum of spinal pressure. During menstruation, advanced pregnancy and in the case of hernia its practice is contra-indicated.

ABOUT MUSCLES

Extensors of the vertebral column including the neck extensors are exercised in antigravity effort involved. The tone of these muscles reflects the mood of the person.

There is isometric contraction of the muscles of the upper limb for maintaining the *Āsana*.

Shoulder extensors act as stabilisers.

Sternomastoid and pectoralis major are stretched.

DHANURVAKRĀSANA

An excellent counter pose to the posterior stretching pose may be found in the posture known as *Dhanurvākṛāsana* or the bow-curve pose. The object is to cause anterior stretching and posterior contraction immediately following the posterior stretching and anterior contraction.

Lie prone on the abdomen. Bend the legs at the knee-joints from behind upward and fold them against their respective thigh. With the arms to the back, at full length, grasp the ankles well with the hands. Then raise the neck simultaneously with a steady lift

and pull upwards on the ankles, while inhaling. Now rest the entire body on only the area of the navel (umbilical region), assuming a somewhat circular position. In order to derive the highest benefit from this pose, the knees should be kept together. Maintain this position as long as it is comfortable with retention of breath. Then, release the hold on the ankles, begin to exhale and assume the starting position-prone on the abdomen, the legs fully stretched out and the arms rested on the floor. It is best to pause before another round.

DHANURVAKRĀSANA

The movements, breathing, and time should be adjusted as follows: (i) upward pull, inhale, 3 seconds; (ii) maintain pose, retention of breath, 6 seconds, alternatively, when, sustained for not more than 2 minutes, slow, rhythmic and normal breathing; and (iii) return to starting position, exhale, 3 seconds. If necessary, pause for suspension
