Utvecklingen av informations och kommunikationsteknik IKT gör det möjligt för människor från hela världen att kopplas samman och utbyta kunskaper Ju mer vi vet och förstärkt om varandra desto större är chansen att människligheten kan uppnå globala utvecklingsmål och välsittande IKT-utvecklingen är associerad med höga krav på datakvalitet och antal uppkopplade enheter Dessa krav karaktäriseras tydligt och måste hanteras med teknologisk utveckling Massiv MIMO eller MIMO står för multiple input multiple output eller flerantennteknik och en grundsten i nästa generations trådlösa kommunikationssystem Huvudanledning till detta är att tekniken kan förbättra spektraleffektiviteten SE vilket är ett mått på hur väl vi kan kommunicera data över begränsade radiofrekvensresurser Tekniken förbättrar även energieffektiviteten EE vilket är ett mått på hur effektivt tekniken använder energi till att kommunicera data Massiv MIMO bygger på användandet av ett stort antal av antenner på basstationerna för att kommunicera med ett flertal användare samtidigt och på samma frekvensresurser Detta möjliggörs genom rumslig multiplexing vilket betyder att signaler från användare på olika platser kan separeras på basstationen i den rumsliga dimensionen Denna separering kräver att basstationen förstärker egenskaperna hos signaler som kommer från de olika användarnas positioner När en ny teknik såsom Massiv MIMO utvecklas är det viktigt att olika alternativa designalternativ utvärderas och jämföras för att identifiera den bästa varianten Detta kan exempelvis vara den variant som uppnår en viss balans mellan hög kommunikationsprestanda och låg kostnad I denna avhandling utvärderas två alternativa sätt att designa signalbehandlingen och hanteringen i Massiv MIMO Dessa jämföras med konventionell Massiv MIMO i termer av SE EE och effektförbrukning Den första alternativa designen kallas verlagrade piloter och bygger på

att kända pilotsignaler och okända datasignaler skickas samtidigt från användarna istället för efter varandra. Pilotsignalerna används för att mäta upp de tre olika kanalerna som signalerna föras över medan datasignalerna innehåller den information som ska kommuniceras. Genom att verlagra pilotsignalerna så behövs inga dedikerade radioresurser för piloter och därmed finns det mer resurser för datan. Dessutom minskar verlagrandet de störningar som kommer från andra användare som använder samma pilot vilket kallas pilotkontaminering. Den andra alternativa designen kallas mixad analog till digital AD-omvandlare. En AD-omvandlare är en krets som behövs på varje antenn för att omvandla analoga radiosignaler till digitala signaler som kan processas i en dator. Bitupplösningen i AD-omvandlaren avgör hur många nivåer som kan användas för att representera den analoga signalen. Ju högre bitupplösning desto fler nivåer och därmed en mer noggrann representation men detta leder även till högre beräkningskomplexitet och effektförbrukning. Mixad AD-omvandlare försöker balansera mellan hög prestanda och låg komplexitet genom att optimera bitupplösningen på varje antenn i ett Massiv MIMO-system. Avhandlingens resultat visar att det går att nå SE i Massiv MIMO genom att använda verlagrade piloter ifall den föreslagna algoritmen MICE-D Massive MIMO iterative channel estimation and decoding används. För bärningarna så skiljer stora och små användare sig i hög mobilitet och i hög bärfrekvens används eller i antalet rumsligt multiplexade användare. När det gäller mixad AD-omvandlare så kan smalförbärningar i SE uppnås jämfört med konventionell Massiv MIMO när bitupplösningen i AD-omvandlarna optimeras under förutsättning att signalstyrkan varierar mellan basstationens antenner. Sammanfattningsvis så kan de alternativa designerna av Massiv MIMO som studerats i avhandlingen jämföras med prestanda för bärningarna jämfört med konventionella metoder. Men trots detta så kan de konventionella metoderna uppnå en bra avvägning mellan hög prestanda och låg komplexitet ifall de optimeras väl.

Analysis of Alternative Massive MIMO Designs Daniel Verenzuela, 2018-03-15. The development of information and communication technologies (ICT) provides the means for reaching global connectivity that can help humanity progress and prosper. This comes with high demands on data traffic and number of connected devices which are rapidly growing and need to be met by technological development. Massive MIMO where MIMO stands for multiple input multiple output is envisioned as a fundamental component of next generation wireless communications for its ability to provide high spectral and energy efficiency (SE and EE respectively). The key feature of this technology is the use of a large number of antennas at the base stations (BS) to spatially multiplex several user equipments (UEs). In the development of new technologies like Massive MIMO many design alternatives need to be evaluated and compared in order to find the best operating point with a preferable tradeoff between high performance and low cost. In this thesis two alternative designs for signal processing and hardware in Massive MIMO are studied and compared with the baseline operation in terms of SE, EE and power consumption. The first design is called superimposed pilot (SP) transmission and is based on superimposing pilot and data symbols to remove the overhead from pilot transmission and reduce pilot contamination. The second design is mixed analog to digital converters (ADCs) and it aims at balancing high performance and low complexity by allowing different ADC bit resolutions across the BS.

antennas The results show that the baseline operation of Massive MIMO properly optimized is the preferred choice However SP and mixed ADCs still have room for improvement and further study is needed to ascertain the full capabilities of these alternative designs , **Medicinal Herbs in Primary Care - E-Book** Jean M.
