[Algebraic Geometry III](#) A.N. Parshin, I.R. Shafarevich, 2013-04-17 Starting with the end of the seventeenth century one of the most interesting directions in mathematics attracting the attention as J Bernoulli Euler Jacobi Legendre Abel among others has been the study of integrals of the form $\int \frac{r dz}{\sqrt{Aw}}$ where w is an algebraic function of z Such integrals are now called abelian Let us examine the simplest instance of an abelian integral one where w is defined by the polynomial equation $1 - w^2 = P(z)$ where the polynomial on the right hand side has no multiple roots In this case the function Aw is called an elliptic integral The value of Aw is determined up to $mv + nv$ where v and v are complex numbers and m and n are $1/2$ integers The set of linear combinations $mv + nv$ forms a lattice $H/\mathbb{C}$ and $\mathbb{C}/\mathbb{C}$ so to each elliptic integral Aw we can associate the torus $\mathbb{C}/H$ On the other hand equation 1 defines a curve in the affine plane $\mathbb{C}^2$ $z = w$ Let us complete $\mathbb{C}^2$ to the projective plane $\mathbb{P}^2$ by the addition of the line at infinity and let us also complete the curve defined 2 by equation 1 The result will be a nonsingular closed curve $E \subset \mathbb{P}^2$ which can also be viewed as a Riemann surface Such a curve is called an elliptic curve

volume is the result of a mainly instructional conference on arithmetic geometry held from July 30 through August 10 1984 at the University of Connecticut in Storrs This volume contains expanded versions of almost all the instructional lectures given during the conference In addition to these expository lectures this volume contains a translation into English of Faltings seminal paper which provided the inspiration for the conference We thank Professor Faltings for his permission to publish the translation and Edward Shipz who did the translation We thank all the people who spoke at the Storrs conference both for helping to make it a successful meeting and enabling us to publish this volume We would especially like to thank David Rohrlich who delivered the lectures on height functions Chapter VI when the second editor was unavoidably detained In addition to the editors Michael Artin and John Tate served on the organizing committee for the conference and much of the

success of the conference was due to them our thanks go to them for their assistance Finally the conference was only made possible through generous grants from the Vaughn Foundation and the National Science Foundation Algebraic Geometry I V.I. previously appeared in book form and substantial parts are worked out here in detail for the first time At least a third of the book is devoted to concrete examples applications and pointers to further developments Whereas Volume I is more elementary the present Volume II is more at the research level and somewhat more specialized Both volumes are also available as hardcover edition as Vols 48 and 49 in the series *Ergebnisse der Mathematik und ihrer Grenzgebiete* *From Number Theory to Physics* Michel Waldschmidt, Pierre Moussa, Jean-Marc Luck, Claude Itzykson, 2013-03-09 The present book contains fourteen expository contributions on various topics connected to Number Theory or Arithmetics and its relationships to Theoretical Physics The first part is mathematically oriented it deals mostly with elliptic curves modular forms zeta functions Galois theory Riemann surfaces and p -adic analysis The second part reports on matters with more direct physical interest such as periodic and quasiperiodic lattices or classical and quantum dynamical systems The contribution of each author represents a short self contained course on a specific subject With very few prerequisites the reader is offered a didactic exposition which follows the author's original viewpoints and often incorporates the most recent developments As we shall explain below there are strong relationships between the different chapters even though every single contribution can be read independently of the others This volume originates in a meeting entitled Number Theory and Physics which took place at the Centre de Physique Les Houches Haute Savoie France on March 7-16 1989 The aim of this interdisciplinary meeting was to gather physicists and mathematicians and to give to members of both communities the opportunity of exchanging ideas and to benefit from each other's specific knowledge in the area of Number Theory and of its applications to the physical sciences Physicists have been given mostly through the program of lectures an exposition of some of the basic methods and results of Number Theory which are the most actively used in their branch **Lectures on Algebraic**

Geometry II Günter Harder, 2011-04-21 This second volume introduces the concept of schemes reviews some commutative algebra and introduces projective schemes The finiteness theorem for coherent sheaves is proved here again the techniques of homological algebra and sheaf cohomology are needed In the last two chapters projective curves over an arbitrary ground field are discussed the theory of Jacobians is developed and the existence of the Picard scheme is proved Finally the author gives some outlook into further developments for instance étale cohomology and states some fundamental theorems

Handbook of Elliptic and Hyperelliptic Curve Cryptography Henri Cohen, Gerhard Frey, Roberto Avanzi, Christophe Doche, Tanja Lange, Kim Nguyen, Frederik Vercauteren, 2005-07-19

The discrete logarithm problem based on elliptic and hyperelliptic curves has gained a lot of popularity as a cryptographic primitive. The main reason is that no subexponential algorithm for computing discrete logarithms on small genus curves is currently available except in very special cases. Therefore curve based cryptosystems require much smaller key sizes than RSA to attain the same security level. This makes them particularly attractive for implementations on memory restricted devices like smart cards and in high security applications.

The Handbook of Elliptic and Hyperelliptic Curve Cryptography introduces the theory and algorithms involved in curve based cryptography. After a very detailed exposition of the mathematical background it provides ready to implement algorithms for the group operations and computation of pairings. It explores methods for point counting and constructing curves with the complex multiplication method and provides the algorithms in an explicit manner. It also surveys generic methods to compute discrete logarithms and details index calculus methods for hyperelliptic curves. For some special curves the discrete logarithm problem can be transferred to an easier one, the consequences are explained and suggestions for good choices are given. The authors present applications to protocols for discrete logarithm based systems including bilinear structures and explain the use of elliptic and hyperelliptic curves in factorization and primality proving. Two chapters explore their design and efficient implementations in smart cards. Practical and theoretical aspects of side channel attacks and countermeasures and a chapter devoted to pseudo random number generation round off the exposition. The broad coverage of all important areas makes this book a complete handbook of elliptic and hyperelliptic curve cryptography and an invaluable reference to anyone interested in this exciting field.
