Annotation This volume contains the papers that were presented at the Third Workshop on Algorithmic Learning Theory held in Tokyo in October 1992. In addition to 3 invited papers, the volume contains 19 papers accepted for presentation selected from 29 submitted extended abstracts. The ALT workshops have been held annually since 1990 and are organized and sponsored by the Japanese Society for Artificial Intelligence. The main objective of these workshops is to provide an open forum for discussions and exchanges of ideas between researchers from various backgrounds in this emerging interdisciplinary field of learning theory. The volume is organized into parts on learning via query, neural networks, inductive inference, analogical reasoning, and approximate learning.

*Algorithmic Learning Theory* Shai Ben-David, John Case, Akira Maruoka, 2004-09-23  
Algorithmic learning theory is mathematics about computer programs which learn from experience. This involves considerable interaction between various mathematical disciplines including theory of computation, statistics, and combinatorics. There is also considerable interaction with the practical empirical fields of machine and statistical learning in which a principal aim is to predict from past data about phenomena useful features of future data from the same phenomena. The papers in this volume cover a broad range of topics of current research in the field of algorithmic learning theory. We have divided the 29 technical contributed papers in this volume into eight categories corresponding to eight sessions reflecting this broad range. The categories featured are Inductive Inference, Approximate Optimization, Algorithms, Online, Sequence Prediction, Statistical Analysis of Unlabeled Data, PAC Learning, Boosting, Statistical supervised Learning, Logic-Based Learning, and Query Reinforcement Learning. Below we give a brief overview of the field placing each of these topics in the general context of the field. Formal models of automated learning reflect various facets of the wide range of activities that can be viewed as learning. A first dichotomy is between viewing learning as an indefinite process and viewing it as a finite activity with a defined termination. Inductive Inference models focus on indefinite learning processes requiring only eventual success of the learner to converge to a satisfactory conclusion.
