

ALMOST COMPLEX STRUCTURES ON SPHERES

PANAGIOTIS KONSTANTIS AND MAURIZIO PARTON

ABSTRACT. In this paper we review the well-known fact that the only spheres admitting an almost complex structure are S^2 and S^6 . The proof described here uses characteristic classes and the Bott periodicity theorem in topological K -theory. This paper originates from the talk “Almost Complex Structures on Spheres” given by the second author at the MAMI workshop “(Non)-existence of complex structures on S^6 ”, held in Marburg from March 27th to March 30th, 2017. It is a review paper, and as such no result is intended to be original. We tried to produce a clear, motivated and as much as possible self-contained exposition.

1. INTRODUCTION

A *complex manifold* is a differentiable manifold M whose transition functions are holomorphic. If $x + iy$ denotes local coordinates around $p \in M$, the multiplication by i induces an endomorphism J_p of the tangent space $T_p(M)$ given by

$$\begin{cases} \frac{\partial}{\partial x}|_p \longmapsto \frac{\partial}{\partial y}|_p \\ \frac{\partial}{\partial y}|_p \longmapsto -\frac{\partial}{\partial x}|_p \end{cases} \quad (1.1)$$

Writing the Cauchy-Riemann equations on the intersection of two overlapping charts, one obtains that J_p is globally defined. The endomorphism $J : T(M) \rightarrow T(M)$, locally defined by (1.1), is an example of almost complex structure. More generally, an *almost complex structure* on a real differentiable manifold M is a linear bundle morphism J of the tangent vector bundle $T(M)$ satisfying $J^2 = -\text{Id}$. The pair (M, J) is called an *almost complex manifold*, and whenever J arises from (1.1) for certain holomorphic coordinates $x + iy$, one says that the almost complex structure J is *integrable*.

One often refers to the above discussion by the sentence: “on a complex manifold the multiplication by i gives a compatible integrable almost complex structure”.

The problem of deciding if a given almost complex structure J is integrable is nowadays an easy task, due to the celebrated Newlander-Nirenberg Theorem [NN57]. Much more challenging is the problem of deciding whether a differentiable manifold admits *any* integrable almost complex structure: in real dimension > 4 , the only known general obstruction is the trivial one, that is, the existence of an almost complex structure.

The Wild World of

4-Manifolds Alexandru Scorpan, 2022-01-26 What a wonderful book I strongly recommend this book to anyone especially graduate students interested in getting a sense of 4 manifolds MAA Reviews The book gives an excellent overview of 4 manifolds with many figures and historical notes Graduate students nonexperts and experts alike will enjoy browsing through it Robion C Kirby University of California Berkeley This book offers a panorama of the topology of simply connected smooth manifolds of dimension four Dimension four is unlike any other dimension it is large enough to have room for wild things to happen but small enough so that there is no room to undo the wildness For example only manifolds of dimension four can exhibit infinitely many distinct smooth structures Indeed their topology remains the least understood today To put things in context the book starts with a survey of higher dimensions and of topological 4 manifolds In the second part the main invariant of a 4 manifold the intersection form and its interaction with the topology of the manifold are investigated In the third part as an important source of examples complex surfaces are reviewed In the final fourth part of the book gauge theory is presented this differential geometric method has brought to light how unwieldy smooth 4 manifolds truly are and while bringing new insights has raised more questions than answers The structure of the book is modular organized into a main track of about two hundred pages augmented by extensive notes at the end of each chapter where many extra details proofs and developments are presented To help the reader the text is peppered with over 250 illustrations and has an extensive index

Contemporary Geometry Hung-Hsi Wu, 2013-06-29 Early one morning in April of 1987 the Chinese mathematician J Q Zhong died unexpectedly of a heart attack in New York He was then near the end of a one year visit in the United States When news of his death reached his Chinese American friends it was immediately decided by one and all that something should be done to preserve his memory The present volume is an outgrowth of this sentiment His friends in China have also established a Zhong Jia Qing Memorial Fund which has since twice awarded the Zhong Jia Qing prizes for Chinese mathematics graduate students It is hoped that at least part of the reasons for the esteem and affection in which he was held by all who knew him would come through in the succeeding pages of this volume The three survey chapters by Li and Treibergs Lu and Siu Chapters 1 3 all center around the areas of mathematics in which Zhong made noteworthy contributions In addition to putting Zhong's mathematical contributions in perspective these articles should be useful also to a large segment of the mathematical community together they give a coherent picture of a sizable portion of contemporary geometry The survey of Lu differs from the other two in that it gives a firsthand account of the work done in the People's Republic of China in several complex variables in the last four decades

the original texts of these important books while presenting them in durable paperback and hardcover editions The goal of the Princeton Legacy Library is to vastly increase access to the rich scholarly heritage found in the thousands of books published by Princeton University Press since its founding in 1905

The Geometry of Jordan and Lie Structures Wolfgang Bertram, 2003-07-01 The geometry of Jordan and Lie structures tries to answer the following question what is the integrated or geometric version of real Jordan algebras triple systems and pairs Lie theory shows the way one has to go Lie groups and symmetric spaces are the geometric version of Lie algebras and Lie triple systems It turns out that both geometries are closely related via a functor between them called the Jordan Lie functor which is constructed in this book The reader is not assumed to have any knowledge of Jordan theory the text can serve as a self contained introduction to real finite dimensional Jordan theory

Moment Maps, Cobordisms, and Hamiltonian Group Actions Victor Guillemin, Viktor L. Ginzburg, Yael Karshon, 2002 During the last 20 years localization has been one of the dominant themes in the area of equivariant differential geometry Typical results are the Duistermaat Heckman theory the Berline Vergne Atiyah Bott localization theorem in equivariant de Rham theory and the quantization commutes with reduction theorem and its various corollaries To formulate the idea that these theorems are all consequences of a single result involving equivariant cobordisms the authors have developed a cobordism theory that allows the objects to be non compact manifolds A key ingredient in this non compact cobordism is an equivariant geometrical object which they call an abstract moment map This is a natural and important generalization of the notion of a moment map occurring in the theory of Hamiltonian dynamics The book contains a number of appendices that include introductions to proper group actions on manifolds equivariant cohomology Spin $\mathfrak{m}$ structures and stable complex structures It is geared toward graduate students and research mathematicians interested in differential geometry It is also suitable for topologists Lie theorists combinatorists and theoretical physicists Prerequisite is some expertise in calculus on manifolds and basic graduate level differential geometry
